- mechanical or freeze-thaw damage to the extended portion of the liner will lead to blockage of the flue or subsequent freeze-thaw damage to the upper courses of surrounding masonry.

This is to limit the probability of the collapse of the chimney, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F44, F20-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- rainwater will flow across the chimney cap and into the flue, which could lead to damage to the liner due to freeze-thaw stresses,
- mechanical or freeze-thaw damage to the extended portion of the liner will lead to blockage of the flue or subsequent freeze-thaw damage to the upper courses of surrounding masonry, or
- flue gases will enter the space between the liner and the chimney.

This is to limit the probability of the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that:

- rainwater will flow across the chimney cap and into the flue, which could lead to damage to the liner due to freeze-thaw stresses,
- flue gases will enter the space between the liner and the chimney, or
- mechanical or freeze-thaw damage to the extended portion of the liner will lead to blockage of the flue or subsequent freeze-thaw damage to the upper courses of surrounding masonry.

This is to limit the probability of the spillage of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- heat or flames from a flue pipe will contact unprotected chimney masonry, which could lead to the ignition of combustible building components, or
- rainwater will flow across the chimney cap and into the flue, which could lead to damage to the liner due to freeze-thaw stresses.

This is to limit the probability of the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that:

- heat or flames from a flue pipe will contact unprotected chimney masonry, which could lead to the ignition of combustible building components, or
- rainwater will flow across the chimney cap and into the flue, which could lead to damage to the liner due to freeze-thaw stresses.

This is to limit the probability of the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Provision: 9.21.4.1.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.20., which contains requirements regarding unit masonry.

---

### **Provision: 9.21.4.2.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.3., which contains requirements regarding concrete.

---

### **Provision: 9.21.4.3.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.15., which contains requirements regarding footings.

---

### **Provision: 9.21.4.4.(1)**

---

### **Objective**

OH1

### **Attributions**

9.21.4.4.(1)(a), 9.21.4.4.(1)(b) [F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that air turbulence near roof surfaces or projections will lead to down-drafts in chimneys, which could lead to backdrafting of fuel-burning appliances, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

9.21.4.4.(1)(a), 9.21.4.4.(1)(b) [F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that air turbulence near roof surfaces or projections will lead to down-drafts in chimneys, which could lead to backdrafting of fuel-burning appliances, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.4.5.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 4.3.2., which provides design criteria for plain and reinforced masonry, to include chimneys to which Part 9 applies.

**Provision: 9.21.4.5.(2)**

---

**Intent(s)**

*Intent 1.* To exempt chimneys from the application of Sentence 9.21.4.5.(1), where the chimneys are inherently stable due to a low height-to-width ratio.

**Provision: 9.21.4.6.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that cracks in the masonry or gaps between the masonry and the liner will lead to the ingress of precipitation or melting snow into the chimney, which could lead to damage to the masonry or to the liner due to freeze-thaw stresses, which could lead to the collapse of the chimney, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that cracks in the masonry or gaps between the masonry and the liner will lead to the ingress of precipitation or melting snow into the chimney, which could lead to damage to the masonry or to the liner due to freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that cracks in the masonry or gaps between the masonry and the liner will lead to the ingress of precipitation or melting snow into the chimney, which could lead to damage to the masonry or to the liner due to freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that cracks in the masonry or gaps between the masonry and the liner will lead to the ingress of precipitation or melting snow into the chimney, which could lead to damage to the masonry or to the liner due to freeze-thaw stresses, which could lead to the leakage of flue gases into living space, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that cracks in the masonry or gaps between the masonry and the liner will lead to the ingress of precipitation or melting snow into the chimney, which could lead to damage to the masonry or to the liner due to freeze-thaw stresses, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

## **Provision: 9.21.4.6.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that precipitation or melting snow will accumulate on the chimney cap or will run off the cap and penetrate under the cap, which could lead to the structural damage and collapse of the chimney due to freeze-thaw stresses, which could lead to harm to persons.

---

## **Provision: 9.21.4.6.(3)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that vertical expansion of the chimney liner when heated will lead to damage or lifting of the concrete cap, which could lead to water ingress, which could lead to structural damage to the chimney due to freeze-thaw stresses, which could lead to the structural failure of the chimney, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that vertical expansion of the chimney liner when heated will lead to damage or lifting of the concrete cap, which could lead to water ingress, which could lead to structural damage to the chimney due to freeze-thaw stresses, which could lead to compromised fire safety, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F20, F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that vertical expansion of the chimney liner when heated will lead to damage or lifting of the concrete cap, which could lead to water ingress, which could lead to structural damage to the chimney due to freeze-thaw stresses, which could lead to compromised fire safety, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Objective**

OS3

**Attributions**

[F20, F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that vertical expansion of the chimney liner when heated will lead to damage or lifting of the concrete cap, which could lead to water ingress, which could lead to structural damage to the chimney due to freeze-thaw stresses, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.21.4.6.(4)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of water leaking through joints in precast concrete or masonry chimney caps, which could lead to water penetrating the masonry or entering between the masonry and the

---

## **Intent Statements: NBC 2010**

liner, which could lead to damage to the masonry or liner due to freeze-thaw stresses, which could lead to the collapse of the chimney, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of water leaking through joints in precast concrete or masonry chimney caps, which could lead to water penetrating the masonry or entering between the masonry and the liner, which could lead to damage to the masonry or liner due to freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F20, F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of water leaking through joints in precast concrete or masonry chimney caps, which could lead to water penetrating the masonry or entering between the masonry and the liner, which could lead to damage to the masonry or liner due to freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of water leaking through joints in precast concrete or masonry chimney caps, which could lead to water penetrating the masonry or entering between the masonry and the liner, which could lead to damage to the masonry or liner due to freeze-thaw stresses, which could lead to the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability of water leaking through joints in precast concrete or masonry chimney caps, which could lead to water penetrating the masonry or entering between the masonry and the liner, which could lead to damage to the masonry or liner due to freeze-thaw stresses, which could

lead to the spillage of combustion products into living space, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.4.7.(1)**

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that smouldering material will accumulate at the bottom of the chimney, which could lead to:

- an increase in the severity of a chimney fire,
- the ignition of the cleanout frame or door, or
- the spillage of smouldering material onto combustible material.

This is to limit the probability of the ignition of combustible building components, which could lead to damage to the building.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that smouldering material will accumulate at the bottom of the chimney, which could lead to:

- an increase in the severity of a chimney fire,
- the ignition of the cleanout frame or door, or
- the spillage of smouldering material onto combustible material.

This is to limit the probability of the ignition of combustible building components, which could lead to harm to persons.

**Provision: 9.21.4.8.(1)**

---

**Objective**

OS2

**Attributions**

[F20, F22-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient resistance to wind loads, which could lead to the structural failure of chimneys, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that excessive conductive heat transfer to the outer surface of chimneys will lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that excessive conductive heat transfer to the outer surface of chimneys will lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F22-OP2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient resistance to wind loads, which could lead to the structural failure of chimneys, which could lead to damage to the building.

---

## **Provision: 9.21.4.9.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20, F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that condensate or corrosive gases from a failed flue liner will lead to the failure of an adjacent flue that serves another appliance, which could lead to backdrafting of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F20, F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that condensate or corrosive gases from a failed flue liner will reach the masonry surrounding adjacent flue liners in the same chimney, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Objective**

OS2

### **Attributions**

[F20, F22-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that condensate or corrosive gases from a failed flue liner will reach the masonry surrounding adjacent flue liners in the same chimney, which could lead to the structural failure of the masonry, which could lead to the collapse of the chimney, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that condensate or corrosive gases from a failed flue liner will lead to the failure of an adjacent flue that serves another appliance, which could lead to backdrafting of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that a chimney fire in one flue liner will lead to a fire in adjacent flue liners, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Provision: 9.21.4.9.(2)**

---

**Objective**

OS2

**Attributions**

[F20, F22-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that joints between flue liner sections will open, which could lead to the leakage of condensate and combustion products into the surrounding masonry, which could lead to the structural damage and collapse of the chimney due to corrosion or freeze-thaw stresses, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that joints between flue liner sections will open, which could lead to the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F20, F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that joints between flue liner sections will open, which could lead to the spillage of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that joints between flue liner sections will open, which could lead to the leakage of condensate and combustion products into the surrounding masonry, which could lead to damage to the liner due to corrosion or freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

## **Provision: 9.21.4.10.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20, F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the ingress of precipitation or melting snow will lead to the premature failure of exterior finishes, structural wood elements or interior finishes, which could lead to the collapse of these building elements, which could lead to harm to persons.

*Intent 2.* To limit the probability that water from rain or melting snow will enter the chimney, which could lead to the structural failure of the masonry due to freeze-thaw stresses, which could lead to the collapse of the chimney, which could lead to harm to persons.

---

## **Provision: 9.21.5.1.(1)**

---

### **Objective**

OP1

### **Attributions**

9.21.5.1.(1)(a), 9.21.5.1.(1)(b) [F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that excessive heat transfer, by conduction or radiation, from masonry or concrete chimneys (especially during chimney fires) will lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Objective**

OS1

**Attributions**

9.21.5.1.(1)(a), 9.21.5.1.(1)(b) [F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that excessive heat transfer, by conduction or radiation, from masonry or concrete chimneys (especially during chimney fires) will lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Provision: 9.21.5.1.(2)**

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that, during a chimney fire, the ignition of creosote and other accumulated combustible material in the cleanout portion of chimneys will lead to excessive heat transfer to combustible building components, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that, during a chimney fire, the ignition of creosote and other accumulated combustible material in the cleanout portion of chimneys will lead to excessive heat transfer to combustible building components, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Provision: 9.21.5.1.(3)**

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that an inadequate clearance will lead to excessive heat conduction or radiation from masonry or concrete chimneys (especially during chimney fires) to combustible flooring, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that an inadequate clearance will lead to excessive heat conduction or radiation from masonry or concrete chimneys (especially during chimney fires) to combustible flooring, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Provision: 9.21.5.2.(1)**

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that flame and smoke from a fire will pass through the space between masonry or concrete chimneys and combustible framing, which could lead to the spread of fire from one level to another in the building, which could lead to damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that flame and smoke from a fire will pass through the space between masonry or concrete chimneys and combustible framing, which could lead to the spread of fire from one level to another in the building, which could lead to harm to persons.

---

### **Provision: 9.21.5.3.(1)**

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that an insufficient thickness of masonry will lead to excessive heat conduction from chimney flues through masonry, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that an insufficient thickness of masonry will lead to excessive heat conduction from chimney flues through masonry, which could lead to the ignition of combustible building components, which could lead to harm to persons.

**Provision: 9.22.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.22.

**Provision: 9.22.1.2.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Sections 9.3. and 9.20., which contain requirements regarding concrete and unit masonry.

**Provision: 9.22.1.2.(2)**

---

**Objective**

OS2

**Attributions**

[F22, F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that inadequate support for masonry over openings will lead to structural failure, which could lead to harm to persons.

*Intent 2.* To clarify that Sentence 9.20.5.2.(2) also applies to lintels supporting masonry over fireplace openings.

**Provision: 9.22.1.3.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Section 9.15. to include footings for masonry and concrete fireplaces.

**Provision: 9.22.1.4.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that wind-induced pressure will lead to a reversal of the airflow, which could lead to the venting of combustion products through the combustion-air duct, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that wind-induced pressure will lead to a reversal of the airflow, which could lead to the venting of combustion products through the combustion-air duct, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

## **Provision: 9.22.2.1.(1)**

---

### **Objective**

OS1

### **Attributions**

[F20, F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that fireplace masonry will be exposed to corrosive gases, high temperatures and thermal shock due to heating and cooling, which could lead to the deterioration of masonry, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F20, F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that fireplace masonry will be exposed to corrosive gases, high temperatures and thermal shock due to heating and cooling, which could lead to the deterioration of masonry, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

## **Provision: 9.22.2.2.(1)**

---

### **Objective**

OS1

### **Attributions**

9.22.2.2.(1)(a), 9.22.2.2.(1)(b) [F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that firebrick liners of inadequate thickness will lead to the excessive conduction of heat through the liners, which could lead to an excessive rise in the temperature of the backup masonry, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

9.22.2.2.(1)(a), 9.22.2.2.(1)(b) [F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that firebrick liners of inadequate thickness will lead to the excessive conduction of heat through the liners, which could lead to an excessive rise in the temperature of the backup masonry, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Provision: 9.22.2.2.(2)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that corrosive gases, high temperatures and thermal shock due to heating and cooling will lead to the premature failure of the mortar between liner elements, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that corrosive gases, high temperatures and thermal shock due to heating and cooling will lead to the premature failure of the mortar between liner elements, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Provision: 9.22.2.2.(3)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that corresponding cracks in firebrick liner units and backing masonry units will provide a path for the flow of flames or radiant heat, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that corresponding cracks in firebrick liner units and backing masonry units will provide a path for the flow of flames or radiant heat, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Provision: 9.22.2.3.(1)**

---

### **Objective**

OH1

### **Attributions**

[F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance or installation of steel liners will fall significantly below expectations, which could lead to the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance or installation of steel liners will fall significantly below expectations, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance or installation of steel liners will fall significantly below expectations, which could lead to the spillage of combustion products into living space, which could lead to the asphyxiation or acute poisoning of persons.

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance or installation of steel liners will fall significantly below expectations, which could lead to the ignition of combustible building components, which could lead to damage to the building.

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20, F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength and rigidity, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads, which could lead to excessive movement, deformation or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where framing members are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20, F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength and rigidity, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads, which could lead to excessive movement, deformation or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

---

## **Intent Statements: NBC 2010**

- structural collapse of wood-frame construction, or
- where framing members are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength and rigidity, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads, which could lead to excessive movement, deformation or failure.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength and rigidity, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads, which could lead to excessive movement, deformation or failure.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

**Intent 1.** To limit the probability of inadequate strength and rigidity, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads, which could lead to excessive movement, deformation or failure.

This is to limit the probability of:

- compromised structural integrity,
- where members support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate strength and rigidity, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads, which could lead to excessive movement, deformation or failure.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

- where framing members are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F81-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate provision for drying, which could lead to the entrapment of surface water or water from the ground transferred through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F81-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drying, which could lead to the entrapment of surface water or water from the ground transferred through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F81-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drying, which could lead to the entrapment of surface water or water from the ground transferred through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F81-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drying, which could lead to the entrapment of surface water or water from the ground transferred through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

For floors and elements supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- where members support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of excessive deflection or vibration, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.23.2.3.(1)**

---

**Objective**

OS2

**Attributions**

[F80-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to or protection from surface water or water from the ground transferred by capillary action through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where framing members are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F80-OP2.1, OP2.3, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to or protection from surface water or water from the ground transferred by capillary action through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where framing members are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

[F80-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to or protection from surface water or water from the ground transferred by capillary action through masonry or concrete, which could lead to wood decay, which could lead to an inability to resist expected gravity or lateral loads.

For floors and elements supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- where members support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

This to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.23.2.3.(2)**

---

**Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.23.2.3.(1) situations where the risk of significant capillary transfer of moisture from surface water or the ground and consequent wood decay is reduced owing to the clearance between the wood member and the ground.

---

**Provision: 9.23.2.4.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.3.2., which contains the basic material requirements for lumber.

---

**Provision: 9.23.3.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20, F22-OS2.5]

---

## **Intent Statements: NBC 2010**

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of nails, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected vertical or lateral loads, which could lead to fastened elements detaching from supporting members.

This is to limit the probability of compromised structural integrity, which could lead to:

- elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

[F20, F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of nails, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected vertical or lateral loads, which could lead to fastened elements detaching from supporting members.

This is to limit the probability of compromised structural integrity, which could lead to:

- elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of nails, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected vertical or lateral loads, which could lead to fastened elements detaching from supporting members.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of nails, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected vertical or lateral loads, which could lead to fastened elements detaching from supporting members.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F80-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate capacity, rigidity or withdrawal resistance, which could lead to premature failure of nailed joints, which could lead to compromised strength of wood members, which could lead to an inability to resist expected vertical or lateral loads, which could lead to fastened elements detaching from supporting members.

For floors and elements supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- where members support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of excessive deflection or vibration, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

## **Provision: 9.23.3.4.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate length and number, or excessive spacing, of nails, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate length and number, or excessive spacing, of nails, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate length and number, or excessive spacing, of nails, which could lead to an inability to resist expected gravity and lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate length and number, or excessive spacing, of nails, which could lead to an inability to resist expected gravity and lateral loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate length and number, or excessive spacing, of nails, which could lead to an inability to resist expected gravity and lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate length and number, or excessive spacing, of nails, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.3.4.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20, F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening or an excessive rate of deterioration of fasteners, which could lead to an inability to resist expected wind loads and seismic effects, which could lead to the separation of exterior walls or wall elements from floors, which could lead to overturning, lifting or sliding of exterior walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt situations from the application of Sentence 9.23.3.4.(1) where another means of fastening the wall framing to the floor framing is provided.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening or an excessive rate of deterioration of fasteners, which could lead to an inability to resist expected wind loads and seismic effects, which could lead to

---

## **Intent Statements: NBC 2010**

the separation of exterior walls or wall elements from floors, which could lead to overturning, lifting or sliding of exterior walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,

### **Intent(s)**

*Intent 1.* To exempt certain fastening of sheathing from the requirements of Sentence 9.23.3.5.(1), if certain conditions are met.

*Intent 2.* To expand the application of Part 4 to include fastening of sheathing where wood-frame construction is in extreme wind and seismic regions.

**Provision: 9.23.3.5.(4)**

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20, F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter, thickness or crown length, or incorrect orientation, of staples, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter, thickness or crown length, or incorrect orientation, of staples, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter, thickness or crown length, or incorrect orientation, of staples, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter, thickness or crown length, or incorrect orientation, of staples, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter, thickness or crown length, or incorrect orientation, of staples, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter, thickness or crown length, or incorrect orientation, of staples, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.3.5.(5)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20, F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of an inadequate nail diameter or head size, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate nail diameter or head size, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate nail diameter or head size, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,

- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate nail diameter or head size, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate nail diameter or head size, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate nail diameter or head size, which could lead to inadequate capacity, rigidity or pull-through resistance, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

## **Provision: 9.23.3.5.(6)**

---

### **Objective**

OS2

### **Attributions**

[F20, F22-OS2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter of screws, which could lead to inadequate capacity or rigidity, which could lead to an inability to resist expected dead and live gravity loads, which could lead to fastened elements detaching from supporting members, which could lead to excessive movement, deformation or deflection.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter of screws, which could lead to inadequate capacity or rigidity, which could lead to an inability to resist expected dead and live gravity loads, which could lead to fastened elements detaching from supporting members, which could lead to excessive movement, deformation or deflection.

This is to limit the probability of compromised structural integrity, which could lead to:

- fastened elements detaching from supporting members, which could lead to elements falling from the building,
- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter of screws, which could lead to inadequate capacity or rigidity, which could lead to an inability to resist expected dead and live gravity loads, which could lead to fastened elements detaching from supporting members, which could lead to excessive movement, deformation or deflection.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of an inadequate diameter of screws, which could lead to inadequate capacity or rigidity, which could lead to an inability to resist expected dead and live gravity loads, which could lead to fastened elements detaching from supporting members, which could lead to excessive movement, deformation or deflection.

For floors and elements supporting floors, this is to limit the probability:

- compromised structural integrity, or
- where members support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate diameter of screws, which could lead to inadequate capacity or rigidity, which could lead to an inability to resist expected dead and live gravity loads, which could lead to fastened elements detaching from supporting members, which could lead to excessive movement, deformation or deflection.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Provision: 9.23.4.1.(1)**

---

### **Intent(s)**

*Intent 1.* To state the application of the span tables referenced in Subsection 9.23.4.

---

### **Provision: 9.23.4.1.(2)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 4.1.3. to include spans for joists, beams and lintels where the live load on any floor exceeds 1.9 kPa.

---

### **Provision: 9.23.4.2.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected lateral, gravity or wind-uplift loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or

- an inability to resist expected loads, which could lead to
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.4.2.(2)**

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inappropriate design, which could lead to an inability to resist expected lateral, gravity or, for exterior floors, wind-uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

**Provision: 9.23.4.2.(3)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to structural failure, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to structural failure, which could lead to damage to the building.

---

### **Provision: 9.23.4.2.(4)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.3, OS2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to damage to the building.

---

### **Provision: 9.23.4.3.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection or failure.

For environmental separators or construction that supports environmental separators, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection or failure.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection or failure.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection or failure.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

**Provision: 9.23.4.3.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of steel, with respect to strength or stiffness, will fall significantly below expectations, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- for environmental separators or construction that supports environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of steel, with respect to strength or stiffness, will fall significantly below expectations, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- for environmental separators or construction that supports environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of steel, with respect to strength or stiffness, will fall significantly below expectations, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection.

For environmental separators or construction that supports environmental separators, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of steel, with respect to strength or stiffness, will fall significantly below expectations, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of steel, with respect to strength or stiffness, will fall significantly below expectations, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of steel, with respect to strength or stiffness, will fall significantly below expectations, which could lead to an inability to resist expected gravity loads, which could lead to excessive deflection.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Provision: 9.23.4.4.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to inadequate strength to support the additional weight of a concrete topping, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of holes or a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of holes or a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of holes or a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of holes or a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of holes or a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of holes or a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Provision: 9.23.5.2.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

---

## **Intent Statements: NBC 2010**

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or

- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of a loss of effective depth, which could lead to an inability to resist expected gravity and lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to resist expected wind loads, which could lead to overturning, lifting or sliding of the superstructure off the foundation, and
- where the superstructure is required to provide lateral support for the foundation, an inability to resist expected lateral earth pressure loads, which could lead to:
  - cracking or differential movement of the foundation, or
  - compromised structural integrity of the foundation, which could lead to deflection or deformation of the superstructure.

For floors and elements supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- where members support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of excessive deflection or vibration, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.23.6.1.(3)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.5] [F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to resist expected wind and seismic loads, which could lead to overturning, lifting or sliding of the superstructure off the foundation, and
- where the superstructure is required to provide lateral support for the foundation, an inability to resist expected lateral earth pressure loads, which could lead to:
  - cracking or differential movement of the foundation, or
  - compromised structural integrity of the foundation, which could lead to deflection or deformation of the superstructure.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of the superstructure or the foundation, or
- for environmental separators or construction that supports environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.5] [F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to resist expected wind and seismic loads, which could lead to overturning, lifting or sliding of the superstructure off the foundation, and
- where the superstructure is required to provide lateral support for the foundation, an inability to resist expected lateral earth pressure loads, which could lead to:
  - cracking or differential movement of the foundation, or
  - compromised structural integrity of the foundation, which could lead to deflection or deformation of the superstructure.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of the superstructure or the foundation, or
- for environmental separators or construction that supports environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, and
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to resist expected wind and seismic loads, which could lead to overturning, lifting or sliding of the superstructure off the foundation, and
- where the superstructure is required to provide lateral support for the foundation, an inability to resist expected lateral earth pressure loads, which could lead to:
  - cracking or differential movement of the foundation, or
  - compromised structural integrity of the foundation, which could lead to deflection or deformation of the superstructure.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected wind and lateral loads, which could lead to columns or posts lifting or sliding off foundations.

This is to limit the probability of:

- for floors and constructions supporting floors, compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected wind and lateral loads, which could lead to columns or posts lifting or sliding off foundations.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- for floors and elements that support floors, persons losing their balance, tripping or falling, or
- the compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

**Provision: 9.23.6.2.(2)**

---

**Objective**

OS2

**Attributions**

[F22-OS2.4, OS2.5]

[F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected wind and lateral loads, which could lead to platforms lifting or sliding off foundations.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for construction that supports environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected wind and lateral loads, which could lead to platforms lifting or sliding off foundations.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or

---

## **Intent Statements: NBC 2010**

- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected wind and lateral loads, which could lead to platforms lifting or sliding off foundations.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected wind and lateral loads, which could lead to platforms lifting or sliding off foundations.

For construction that supports environmental separators, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.23.6.2.(3)**

---

**Intent(s)**

*Intent 1.* To exempt certain platforms from the requirement for anchorage stated in Sentences 9.23.6.2.(1) and 9.23.6.2.(2), in cases where adverse effects from differential movement are unlikely to occur.

**Provision: 9.23.6.3.(1)**

---

**Objective**

OS2

**Attributions**

[F22-OS2.3, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of anchorage for smaller buildings will fall significantly below expectations, which could lead to an inability to resist expected wind loads, which could lead to overturning, lifting or sliding of the superstructure off the foundation, which could lead to harm to persons.

*Intent 2.* To supersede the application of Sentence 9.23.6.1.(2).

**Provision: 9.23.7.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing length for the supported framing,
- inadequate bending strength, or
- inadequate thickness.

This is to limit the probability of an inability to resist expected gravity, lateral and wind-uplift loads, which could lead to:

- crushing of sill plates,
- failure of sill plates, or
- pull-through or inadequate penetration of fasteners, which could lead to failure of connections.

This is to limit the probability of inadequate support for or anchorage of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing length for the supported framing,
- inadequate bending strength, or
- inadequate thickness.

This is to limit the probability of an inability to resist expected gravity, lateral and wind-uplift loads, which could lead to:

- crushing of sill plates,
- failure of sill plates, or
- pull-through or inadequate penetration of fasteners, which could lead to failure of connections.

This is to limit the probability of inadequate support for or anchorage of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing length for the supported framing,
- inadequate bending strength, or
- inadequate thickness.

This is to limit the probability of an inability to resist expected gravity, lateral and wind-uplift loads, which could lead to:

- crushing of sill plates,
- failure of sill plates, or
- pull-through or inadequate penetration of fasteners, which could lead to failure of connections.

This is to limit the probability of inadequate support for or anchorage of floor assemblies.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing length for the supported framing,
- inadequate bending strength, or
- inadequate thickness.

This is to limit the probability of an inability to resist expected gravity, lateral and wind-uplift loads, which could lead to:

- crushing of sill plates,
- failure of sill plates, or
- pull-through or inadequate penetration of fasteners, which could lead to failure of connections.

This is to limit the probability of inadequate support for or anchorage of floor assemblies.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing length for the supported framing,
- inadequate bending strength, or
- inadequate thickness.

This is to limit the probability of an inability to resist expected gravity, lateral and wind-uplift loads, which could lead to:

- crushing of sill plates,
- failure of sill plates, or
- pull-through or inadequate penetration of fasteners, which could lead to failure of connections.

This is to limit the probability of inadequate support for or anchorage of floor assemblies.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing length for the supported framing,
- inadequate bending strength, or
- inadequate thickness.

This is to limit the probability of an inability to resist expected gravity, lateral and wind-uplift loads, which could lead to:

- crushing of sill plates,
- failure of sill plates, or
- pull-through or inadequate penetration of fasteners, which could lead to failure of connections.

This is to limit the probability of inadequate support for or anchorage of floor assemblies.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.23.7.2.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of unlevel surfaces underlying sill plates, which could lead to discontinuous support for sill plates, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure of sill plates.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of unlevel surfaces underlying sill plates, which could lead to discontinuous support for sill plates, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure of sill plates.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of unlevel surfaces underlying sill plates, which could lead to discontinuous support for sill plates, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure of sill plates.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening of beam members, which could lead to inadequate load distribution between members, which could lead to inadequate bending or shear strength of the built-up beam, which could lead to an inability to resist expected gravity loads, which could lead to failure of the beam, which could lead to structural collapse, which could lead to harm to persons.

*Intent 2.* To exempt situations where another means of joining built-up wood beams is provided from the application of Sentence 9.23.8.3.(7).

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening of beam members, which could lead to inadequate load distribution between members, which could lead to inadequate bending or shear strength of the built-up beam, which could lead to an inability to resist expected gravity loads, which could lead to failure of the beam, which could lead to structural collapse, which could lead to damage to the building.

*Intent 2.* To exempt situations from the application of Sentence 9.23.8.3.(7) where another means of joining built-up wood beams is provided.

---

### **Provision: 9.23.9.1.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity loads, which could lead to:

- crushing of floor joists, and sill plates or beams,
- inadequate support for floor joists,
- where not embedded in a foundation, the separation of joists from supporting members, or
- where not embedded in a foundation, but end-nailed, strapped or blocked, the twisting of joists.

This is to limit the probability of the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity loads, which could lead to:

- crushing of floor joists, and sill plates or beams,

- inadequate support for floor joists,
- where not embedded in a foundation, the separation of joists from supporting members, or
- where not embedded in a foundation, but end-nailed, strapped or blocked, the twisting of joists.

This is to limit the probability of the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity loads, which could lead to:

- crushing of floor joists, and sill plates or beams,
- inadequate support for floor joists,
- where not embedded in a foundation, the separation of joists from supporting members, or
- where not embedded in a foundation, but end-nailed, strapped or blocked, the twisting of joists.

This is to limit the probability of the excessive movement, deformation or failure of floor assemblies.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

- inadequate support for floor joists,
- where not embedded in a foundation, the separation of joists from supporting members, or
- where not embedded in a foundation, but end-nailed, strapped or blocked, the twisting of joists.

This is to limit the probability of the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity loads, which could lead to:

- crushing of floor joists, and sill plates or beams,
- inadequate support for floor joists,
- where not embedded in a foundation, the separation of joists from supporting members, or
- where not embedded in a foundation, but end-nailed, strapped or blocked, the twisting of joists.

This is to limit the probability of the excessive movement, deformation or failure of floor assemblies.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity loads, which could lead to:

- crushing of floor joists, and sill plates or beams,
- inadequate support for floor joists,
- where not embedded in a foundation, the separation of joists from supporting members, or
- where not embedded in a foundation, but end-nailed, strapped or blocked, the twisting of joists.

This is to limit the probability of the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.23.9.1.(2)**

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for joists, which could lead to an inability to resist expected gravity loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for joists, which could lead to an inability to resist expected gravity loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of vertical displacement of floors at beams, which could lead to inadequate support for floor joists, which could lead to an inability to resist expected gravity loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

[F22-OS3.1]

---

## **Intent Statements: NBC 2010**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of vertical displacement of floors at beams, which could lead to inadequate support for floor joists, which could lead to an inability to resist expected gravity loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Provision: 9.23.9.3.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral restraint, which could lead to twisting due to shrinkage or expected gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

**Intent 1.** To limit the probability of inadequate lateral restraint, which could lead to twisting due to shrinkage or expected gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate lateral restraint, which could lead to twisting due to shrinkage or expected gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate restraint of the bottoms of joists, which could lead to excessive twisting of joists, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate restraint of the bottoms of joists, which could lead to excessive twisting of joists, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or

- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate restraint of the bottoms of joists, which could lead to excessive twisting of joists, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity, or
- for exterior floors, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate restraint of the bottoms of joists, which could lead to excessive twisting of joists, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1]

---

## **Intent Statements: NBC 2010**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate restraint of the bottoms of joists, which could lead to excessive twisting of joists, which could lead to an inability to resist expected gravity and lateral loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate dimensions or excessive spacing, which could lead to inadequate support, which could lead to an inability to resist dead loads from walls, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate dimensions or excessive spacing, which could lead to inadequate support, which could lead to an inability to resist dead loads from walls, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, and
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate dimensions or excessive spacing, which could lead to inadequate support, which could lead to an inability to resist dead loads from walls, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate dimensions or excessive spacing, which could lead to inadequate support, which could lead to an inability to resist dead loads from walls, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate dimensions or excessive spacing, which could lead to inadequate support, which could lead to an inability to resist dead loads from walls, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1]

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate dimensions or excessive spacing, which could lead to inadequate support, which could lead to an inability to resist dead loads from walls, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.9.8.(3)**

---

**Intent(s)**

*Intent 1.* To clarify the application of Sentences 9.23.9.8.(1), 9.23.9.8.(2), 9.23.9.8.(4), 9.23.9.8.(5) and 9.23.9.8.(6) in cases where the weight of non-loadbearing walls is transferred directly to floor framing.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.23.9.8.(4)**

---

#### **Objective**

OS3

#### **Attributions**

[F22-OS3.1]

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate vertical support, which could lead to an inability to resist expected gravity loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate vertical support, which could lead to an inability to resist expected gravity loads, which could lead to the excessive movement, deformation or failure of floor assemblies.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of overloading cantilevered floor joists, which could lead to excessive bending moments, which could lead to an inability to resist expected roof loads, which could lead to the excessive movement, deformation or failure of floor or roof assemblies.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

## **Provision: 9.23.9.9.(3)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate leverage provided by the inboard portion of cantilevered joists,
- inadequate resistance, by headers and fasteners, to upward reactions, or
- inadequate fastening of the inboard portion of cantilevered joists.

This is to limit the probability of:

- the excessive movement, deformation or failure of floor assemblies, or
- the excessive deflection of the roof.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate leverage provided by the inboard portion of cantilevered joists,
- inadequate resistance, by headers and fasteners, to upward reactions, or
- inadequate fastening of the inboard portion of cantilevered joists.

This is to limit the probability of:

- the excessive movement, deformation or failure of floor assemblies, or
- the excessive deflection of the roof.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- for exterior floors or floors supporting environmental separators, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate leverage provided by the inboard portion of cantilevered joists,
- inadequate resistance, by headers and fasteners, to upward reactions, or
- inadequate fastening of the inboard portion of cantilevered joists.

This is to limit the probability of:

- the excessive movement, deformation or failure of floor assemblies, or
- the excessive deflection of the roof.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate leverage provided by the inboard portion of cantilevered joists,
- inadequate resistance, by headers and fasteners, to upward reactions, or
- inadequate fastening of the inboard portion of cantilevered joists.

This is to limit the probability of:

- the excessive movement, deformation or failure of floor assemblies, or

- the excessive deflection of the roof.

This is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate leverage provided by the inboard portion of cantilevered joists,
- inadequate resistance, by headers and fasteners, to upward reactions, or
- inadequate fastening of the inboard portion of cantilevered joists.

This is to limit the probability of:

- the excessive movement, deformation or failure of floor assemblies, or
- the excessive deflection of the roof.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1]

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate leverage provided by the inboard portion of cantilevered joists,
- inadequate resistance, by headers and fasteners, to upward reactions, or
- inadequate fastening of the inboard portion of cantilevered joists.

This is to limit the probability of:

- the excessive movement, deformation or failure of floor assemblies, or
- the excessive deflection of the roof.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or

---

## **Intent Statements: NBC 2010**

- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Provision: 9.23.10.1.(1)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area or excessive slenderness, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area or excessive slenderness, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where studs support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area or excessive slenderness, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area or excessive slenderness, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area or excessive slenderness, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area or excessive slenderness, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

**Intent 1.** To limit the probability that stud orientation that is inconsistent with the slenderness-ratio assumptions upon which stud size, height and spacing are based will lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.10.3.(2)**

---

**Intent(s)**

**Intent 1.** To modify the application of Sentence 9.23.10.3.(1) and allow studs to be installed 'on the flat' in constructions where the studs are subject to limited gravity and lateral loads.

---

**Provision: 9.23.10.3.(3)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability that studs installed 'on the flat' will not act compositely with the sheathing and will be subject to excessive gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that studs installed 'on the flat' will not act compositely with the sheathing and will be subject to excessive gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that studs installed 'on the flat' will not act compositely with the sheathing and will be subject to excessive gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that studs installed 'on the flat' will not act compositely with the sheathing and will be subject to excessive gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability that studs installed 'on the flat' will not act compositely with the sheathing and will be subject to excessive gravity and lateral loads, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.23.10.4.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity, which could lead to member instability, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity, which could lead to member instability, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

**Intent 1.** To limit the probability of discontinuity, which could lead to member instability, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

**Intent 1.** To limit the probability of discontinuity, which could lead to member instability, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of discontinuity, which could lead to member instability, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity, which could lead to member instability, which could lead to an inability to resist expected gravity or lateral loads, which could lead to excessive deflection or failure.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

## **Provision: 9.23.10.5.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of studs providing inadequate support and nailing surfaces for vertical edges of interior finishes, sheathing or cladding materials, which could lead to inadequate strength of wood-frame assemblies, which could lead to an inability to resist expected vertical or lateral loads.

This is to limit the probability of:

- detachment or separation of interior finishes, sheathing or cladding from supporting members,
- displacement of sheathing or cladding, or
- inadequate racking resistance for exterior walls and lateral support of walls, where finishes, sheathing or cladding provide required racking or buckling resistance.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of studs providing inadequate support and nailing surfaces for vertical edges of interior finishes, sheathing or cladding materials, which could lead to inadequate strength of wood-frame assemblies, which could lead to an inability to resist expected vertical or lateral loads.

This is to limit the probability of:

- detachment or separation of interior finishes, sheathing or cladding from supporting members,
- displacement of sheathing or cladding, or
- inadequate racking resistance for exterior walls and lateral support of walls, where finishes, sheathing or cladding provide required racking or buckling resistance.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of studs providing inadequate support and nailing surfaces for vertical edges of interior finishes, sheathing or cladding materials, which could lead to inadequate strength of wood-frame assemblies, which could lead to an inability to resist expected vertical or lateral loads.

This is to limit the probability of:

- detachment or separation of interior finishes, sheathing or cladding from supporting members,
- displacement of sheathing or cladding, or
- inadequate racking resistance for exterior walls and lateral support of walls, where finishes, sheathing or cladding provide required racking or buckling resistance.

---

## **Intent Statements: NBC 2010**

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH4

### **Attributions**

9.23.10.6.(3)(b) [F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that studs will not provide adequate support to lintels or will not have adequate capacity to transfer loads, which could lead to studs or lintels being unable to resist expected gravity and lateral loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

9.23.10.6.(3)(b) [F20, F22-OS3.1] Applies to floors and elements that support floors.

9.23.10.6.(3)(b) [F20, F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that studs will not provide adequate support to lintels or will not have adequate capacity to transfer loads, which could lead to studs or lintels being unable to resist expected gravity and lateral loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- for floors and elements that support floors, persons losing their balance, tripping or falling, or
- the compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

9.23.10.6.(3)(b) [F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that studs will not provide adequate support to lintels or will not have adequate capacity to transfer loads, which could lead to studs or lintels being unable to resist expected gravity and lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.23.11.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection or failure of wall plates,
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls, or
- inadequate lateral support for the ends of studs.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection or failure of wall plates,
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls, or
- inadequate lateral support for the ends of studs.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection or failure of wall plates,
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls, or
- inadequate lateral support for the ends of studs.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity and lateral loads, which could lead to:

---

## **Intent Statements: NBC 2010**

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection or failure of wall plates,
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls, or
- inadequate lateral support for the ends of studs.

Where walls support floors, this is to limit the probability of:

- the excessive deformation of floors, which could lead to compromised operation of doors required for egress in an emergency, and
- excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection or failure of wall plates,
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls, or
- inadequate lateral support of the ends of studs.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

**Intent 1.** To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

Where walls support floors, this is to limit the probability of:

- the excessive deformation of floors, which could lead to compromised operation of doors required for egress in an emergency, or
- the excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.11.3.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members in construction where a lintel will serve the function of a second top plate, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or

---

## **Intent Statements: NBC 2010**

- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members in construction where a lintel will serve the function of a second top plate, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members in construction where a lintel will serve the function of a second top plate, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,

- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate capacity to transfer loads from supported floor and roof framing members in construction where a lintel will serve the function of a second top plate, which could lead to an inability to resist expected gravity and lateral loads, which could lead to:

- the inadequate distribution of vertical loads to and from studs, which could lead to the excessive deflection of wall plates, or
- inadequate diaphragm action of plates, which could lead to the excessive deflection of walls.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate connection between wall assemblies that provide transverse support, which could lead to an inability to resist expected lateral loads, which could lead to the excessive deflection or failure of walls.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate connection between wall assemblies that provide transverse support, which could lead to an inability to resist expected lateral loads, which could lead to the excessive deflection or failure of walls.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate connection between wall assemblies that provide transverse support, which could lead to an inability to resist expected lateral loads, which could lead to the excessive deflection or failure of walls.

Where walls support floors, this is to limit the probability of:

- the excessive deformation of floors, which could lead to compromised operation of doors required for egress in an emergency, or
- the excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

**Provision: 9.23.11.4.(3)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity between top plates, which could lead to an inability to resist expected lateral loads, which could lead to the excessive deflection or failure of wall plates.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or

---

## **Intent Statements: NBC 2010**

- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity between top plates, which could lead to an inability to resist expected lateral loads, which could lead to the excessive deflection or failure of wall plates.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity between top plates, which could lead to an inability to resist expected lateral loads, which could lead to the excessive deflection or failure of wall plates.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To provide a cross-reference to Sentence 9.23.11.4.(4) and thereby further define its application.

---

**Intent 1.** To limit the probability of the inadequate distribution of loads among lintel members, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or

---

## **Intent Statements: NBC 2010**

- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability the inadequate distribution of loads among lintel members, which could lead to an inability to resist expected gravity and lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate distribution of loads among lintel members, which could lead to an inability to resist expected gravity and lateral loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or

- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate distribution of loads among lintel members, which could lead to an inability to resist expected gravity and lateral loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate distribution of loads among lintel members, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.12.2.(3)**

---

**Intent(s)**

*Intent 1.* To clarify that lintel members need not be in contact with each other: spacing members to match the wall width will facilitate the fastening of cladding, sheathing and interior finishes.

---

## **Intent Statements: NBC 2010**

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity and lateral loads around openings.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity and lateral loads around openings.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of excessively long spans, which could lead to an inability to resist expected gravity and lateral loads around openings.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive deflection or vibration of floors, or
  - the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

### **Provision: 9.23.12.3.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of insufficiently thick lintel members or of inadequate fastening of double-member lintels, which could lead to inadequate load distribution, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of insufficiently thick lintel members or of inadequate fastening of double-member lintels, which could lead to inadequate load distribution, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where wood-frame construction supports or is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of insufficiently thick lintel members or of inadequate fastening of double-member lintels, which could lead to inadequate load distribution, which could lead to an inability to resist expected gravity and lateral loads.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral support at a discontinuity in the floor diaphragm, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to walls that support floors.

### **Intent(s)**

**Intent 1.** To limit the probability of inadequate lateral support at a discontinuity in the floor diaphragm, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate lateral support at a discontinuity in the floor diaphragm, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.13.5.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

**Intent(s)**

**Intent 1.** To limit the probability of an inability to resist expected lateral loads, which could lead to excessive racking.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected lateral loads, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or

- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

---

## **Intent Statements: NBC 2010**

- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.23.13.5.(2)**

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of excessive spacing of braced wall bands constructed with braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive spacing of braced wall bands constructed with braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or

---

## **Intent Statements: NBC 2010**

- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive spacing of braced wall bands constructed with braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.23.13.5.(3)**

---

### **Intent(s)**

*Intent 1.* To exempt perimeter wall constructions of relatively small projecting spaces that do not support floors and whose roofs are integral with the roof of the main structure or are securely attached to the main structure from the provisions for braced wall bands and braced wall panels in Sentence 9.23.13.5.(1).

---

### **Provision: 9.23.13.5.(4)**

---

### **Intent(s)**

*Intent 1.* To exempt walls in small detached buildings where the potential for negative consequences due to compromised structural integrity is low from the provisions for braced wall bands and braced wall panels in Sentence 9.23.13.5.(1).

*Intent 2.* To exempt the front wall of attached garages that are lightly loaded and capable of transferring the lateral loads to the main structure through diaphragm action of the roof from the provisions for braced wall bands and braced wall panels in Sentence 9.23.13.5.(1).

---

**Provision: 9.23.13.5.(5)**

---

**Intent(s)**

*Intent 1.* To exempt the front wall of attached garages that are capable of transferring the lateral loads to the main structure through diaphragm action of the floor and the roof from the provisions for braced wall bands and braced wall panels in Sentence 9.23.13.5.(1).

---

**Provision: 9.23.13.6.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately clad, sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

**Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately clad, sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,

---

## **Intent Statements: NBC 2010**

- compromised operation of doors or windows, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately clad, sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately clad, sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to walls that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately clad, sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately clad, sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

OS3

### **Attributions**

[F22-OS3.1] Applies to walls that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to the excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to walls that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be adequately sheathed or finished, which could lead to an inability to develop the necessary load-resisting diaphragm action, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Provision: 9.23.13.6.(3)**

---

### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.23.13.6.(2) and allow interior braced wall panels that are sheathed with wood-based material and have stronger panel edge fastening to be sheathed on one side only.

---

### **Provision: 9.23.13.6.(4)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be consistently sheathed or finished, which could lead to the formation of a weak storey, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be consistently sheathed or finished, which could lead to the formation of a weak storey, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be consistently sheathed or finished, which could lead to the formation of a weak storey, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be consistently sheathed or finished, which could lead to the formation of a weak storey, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or

- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be consistently sheathed or finished, which could lead to the formation of a weak storey, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the braced wall panels will not be consistently sheathed or finished, which could lead to the formation of a weak storey, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

### **Provision: 9.23.13.6.(5)**

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

**Intent 1.** To limit the probability that the exterior braced wall panels will not be adequately sheathed or braced, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the exterior braced wall panels will not be adequately sheathed or braced, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

### **Provision: 9.23.13.6.(6)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

### **Intent(s)**

*Intent 1.* To limit the probability that the number and distribution of higher strength braced wall panels will not be sufficient, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

**Intent(s)**

*Intent 1.* To limit the probability that the number and distribution of higher strength braced wall panels will not be sufficient, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that the number and distribution of higher strength braced wall panels will not be sufficient, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability that the number and distribution of higher strength braced wall panels will not be sufficient, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or

---

## **Intent Statements: NBC 2010**

- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to walls that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that the number and distribution of higher strength braced wall panels will not be sufficient, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the number and distribution of higher strength braced wall panels will not be sufficient, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.13.7.(1)**

---

**Intent(s)**

*Intent 1.* To modify the application of Sentence 9.23.13.5.(1) and allow one exterior wall of the uppermost storey in each orthogonal direction to be set back from the exterior wall of the storey below where the amount of setback is limited and the construction of the next interior braced wall band of the storey below is enhanced to compensate.

---

**Provision: 9.23.13.7.(2)**

---

**Attributions****Intent(s)**

*Intent 1.* To modify the application of Sentence 9.23.13.5.(1) and allow one exterior wall of the uppermost storey in each orthogonal direction to be set back from the exterior wall of the storey below where the roof or floor supporting an exterior uppermost storey wall that is set back is constructed to transfer the lateral loads by diaphragm action.

---

**Provision: 9.23.13.7.(3)**

---

**Intent(s)**

*Intent 1.* To modify the application of Sentence 9.23.13.5.(1) and allow one exterior wall of the uppermost storey in each orthogonal direction to be set back from the exterior wall of the storey below where the exterior walls perpendicular to an exterior uppermost storey wall that is set back are reinforced to be sufficiently strong to transfer the forces to the lateral force resisting system.

---

**Provision: 9.23.13.7.(4)**

---

**Intent(s)**

*Intent 1.* To modify the application of Sentence 9.23.13.5.(1) and allow increased spacings between braced wall panels where the minimum length of any braced wall panel is increased to compensate for the increased spacing.

---

**Provision: 9.23.13.7.(5)**

---

**Intent(s)**

*Intent 1.* To modify the application of Sentence 9.23.13.5.(1) and allow increased spacing between braced wall bands where the interior braced wall band whose spacing is being increased has augmented construction and continuity requirements to compensate for the increased spacing.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.23.13.7.(6)**

---

#### **Intent(s)**

*Intent 1.* To modify the application of Sentence 9.23.13.5.(1) and allow a decreased length of braced wall panels in an exterior braced wall band where the adjacent interior braced wall band has augmented construction and continuity requirements to compensate for the decreased spacing.

### **Provision: 9.23.13.7.(7)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that the upper storey braced wall panel will be excessively stronger than the lower storey braced wall band, which could lead to a weak storey, which could lead to compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that the upper storey braced wall panel will be excessively stronger than the lower storey braced wall band, which could lead to a weak storey, which could lead to compromised structural integrity, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that the upper storey braced wall panel will be excessively stronger than the lower storey braced wall band, which could lead to a weak storey, which could lead to compromised structural integrity, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability that the upper storey braced wall panel will be excessively stronger than the lower storey braced wall band, which could lead to a weak storey, which could lead to compromised structural integrity, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the upper storey braced wall panel will be excessively stronger than the lower storey braced wall band, which could lead to a weak storey, which could lead to compromised structural integrity, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the upper storey braced wall panel will be excessively stronger than the lower storey braced wall band, which could lead to a weak storey, which could lead to compromised structural integrity, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- an inability to transfer expected gravity loads or positive wind loads at their upper ends, or
- an inability to resist expected negative wind loads, which could lead to tension separation of roof peaks.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction,
- where roof and ceiling framing members support required elements of environmental separators, the excessive deformation, displacement or failure of these elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators, or
- where roof and ceiling framing members support assemblies exposed to the exterior, excessive water ingress, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate connection of rafters at ridges, which could lead to:

- an inability to transfer expected gravity loads or positive wind loads at their upper ends, or
- an inability to resist expected negative wind loads, which could lead to tension separation of roof peaks.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction,
- where roof and ceiling framing members support required elements of environmental separators, the excessive deformation, displacement or failure of these elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators, or
- where roof and ceiling framing members support assemblies exposed to the exterior, excessive water ingress, which could lead to deterioration.

This is to limit the probability of damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate connection of rafters at ridges, which could lead to:

- an inability to transfer expected gravity loads or positive wind loads at their upper ends, or
- an inability to resist expected negative wind loads, which could lead to tension separation of roof peaks.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate connection of rafters at ridges, which could lead to:

- an inability to transfer expected gravity loads or positive wind loads at their upper ends, or
- an inability to resist expected negative wind loads, which could lead to tension separation of roof peaks.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate load distribution among floor joists,
- inadequate backing for insulation, or
- inadequate support for air barrier systems.

This is to limit the probability of an inability to resist expected gravity loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction,
- where roof and ceiling framing members support required elements of environmental separators, the excessive deformation, displacement or failure of these elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators, or
- where roof and ceiling framing members support assemblies exposed to the exterior, excessive water ingress, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F22-OH4]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate load distribution among floor joists,
- inadequate backing for insulation, or
- inadequate support for air barrier systems.

This is to limit the probability of an inability to resist expected gravity loads.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate load distribution among floor joists,
- inadequate backing for insulation, or
- inadequate support for air barrier systems.

This is to limit the probability of an inability to resist expected gravity loads.

Where assemblies are required to provide fire resistance, this is to limit the probability of excessive deflection of the roof, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate load distribution among floor joists,
- inadequate backing for insulation, or
- inadequate support for air barrier systems.

This is to limit the probability of an inability to resist expected gravity loads.

This is to limit the probability of:

- compromised structural integrity, or
- for exterior floors or environmental separators supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the excessive deflection, deformation or displacement of walls, which could lead to compromised operation of doors or windows required for egress in an emergency, or
- the excessive deflection or vibration of supported floors, which could lead to persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate ridge support, which could lead to an inability to resist expected gravity loads, which could lead to the lower ends of rafters or joists moving outward, which could lead to:

- the failure of roof rafters or joists, or supporting walls, or

---

## **Intent Statements: NBC 2010**

- the excessive deflection of roof rafters or joists.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction,
- where roof and ceiling framing members support required elements of environmental separators, the excessive deformation, displacement or failure of these elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators, or
- where roof and ceiling framing members support assemblies exposed to the exterior, excessive water ingress, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate ridge support, which could lead to an inability to resist expected gravity loads, which could lead to the lower ends of rafters or joists moving outward, which could lead to:

- the failure of roof rafters or joists, or supporting walls, or
- the excessive deflection of roof rafters or joists.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- where supporting walls serve as an environmental separator or where roof joists support elements of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate ridge support, which could lead to an inability to resist expected gravity loads, which could lead to the lower ends of rafters or joists moving outward, which could lead to:

- the failure of roof rafters or joists, or supporting walls, or
- the excessive deflection of roof rafters or joists.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate ridge support, which could lead to an inability to resist expected gravity loads, which could lead to the lower ends of rafters or joists moving outward, which could lead to:

- the failure of roof rafters or joists, or supporting walls, or
- the excessive deflection of roof rafters or joists.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate ridge support, which could lead to an inability to resist expected gravity loads, which could lead to the lower ends of rafters or joists moving outward, which could lead to:

- the failure of roof rafters or joists, or supporting walls, or
- the excessive deflection of roof rafters or joists.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.23.14.8.(2)**

---

#### **Intent(s)**

*Intent 1.* To limit the application of Sentence 9.23.4.2.(4).

### **Provision: 9.23.14.8.(3)**

## **Intent Statements: NBC 2010**

- the structural collapse of wood-frame construction, or
- where roof joists support required elements of environmental separators, the excessive deformation, displacement or failure of these elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators.

This is to limit the probability of damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that low-strength interior finishes will be relied on to provide lateral restraint, which could lead to an inability to resist expected gravity or lateral loads or shrinkage stresses due to drying, which could lead to joists twisting, which could lead to failure of the ceiling.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that low-strength interior finishes will be relied on to provide lateral restraint, which could lead to an inability to resist expected gravity or lateral loads or shrinkage stresses due to drying, which could lead to joists twisting, which could lead to failure of the ceiling.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

**Provision: 9.23.14.10.(1)**

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate depth, which could lead to inadequate strength, which could lead to an inability to resist bending stress imposed by struts or dwarf walls in addition to other expected gravity and lateral loads, which could lead to:

- the failure of the roof or of the ceiling joists, or
- the excessive deflection of the roof, which could lead to the opening of joints.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction,
- where roof and ceiling framing members support required elements of environmental separators, the excessive deformation, displacement or failure of these elements, which could lead to deterioration, which could lead to further compromised structural integrity of roofs or environmental separators, or
- where roof and ceiling framing members support assemblies exposed to the exterior, excessive water ingress, which could lead to deterioration.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.5]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate depth, which could lead to inadequate strength, which could lead to an inability to resist bending stress imposed by struts or dwarf walls in addition to other expected gravity and lateral loads, which could lead to:

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that roof sheathing will not be installed or that inappropriate roof sheathing will be installed, which could lead to:

- the structure being unable to distribute the roof loads, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure of the structural system, or
- insufficient support of the roofing material, which could lead to excessive deflection or failure of the roofing material.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- precipitation ingress, which could lead to the deterioration of the roof or elements protected by the roof, which could lead to compromised structural integrity of the roof or elements protected by the roof.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that roof sheathing will not be installed or that inappropriate roof sheathing will be installed, which could lead to:

- the structure being unable to distribute the roof loads, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure of the structural system, or
- insufficient support of the roofing material, which could lead to excessive deflection or failure of the roofing material.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- precipitation ingress, which could lead to the deterioration of the roof or elements protected by the roof, which could lead to compromised structural integrity of the roof or elements protected by the roof.

This is to limit the probability of damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

**Intent 1.** To limit the probability that roof sheathing will not be installed or that inappropriate roof sheathing will be installed, which could lead to:

- the structure being unable to distribute the roof loads, which could lead to an inability to resist expected gravity and lateral loads, which could lead to excessive deflection or failure of the structural system, or
- insufficient support of the roofing material, which could lead to excessive deflection or failure of the roofing material.

This is to limit the probability of:

- the displacement or failure of required environmental separation elements, or
- precipitation or meltwater ingress.

This is to limit the probability of:

- condensation,
- water ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity or drafts,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.23.16.2.(1)**

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.5]

**Intent(s)**

**Intent 1.** To limit the probability that performance, with respect to strength, deflection and resistance to moisture, will fall significantly below expectations, which could lead to an inability to resist expected gravity and lateral loads, which could lead to damage to roofing.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- precipitation ingress, which could lead to deterioration, which could lead to further compromised structural integrity of the roof.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inadequate clearance, which could lead to an inability to accommodate dimensional changes due to changes in moisture content, which could lead to jamming of sheet edges, which could lead to buckling, which could lead to damage to roofing.

Where wood-frame construction supports or is part of an environmental separator, this is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- precipitation ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate clearance, which could lead to an inability to accommodate dimensional changes due to changes in moisture content, which could lead to jamming of sheet edges, which could lead to buckling, which could lead to damage to roofing.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support or fastening for exterior cladding, which could lead to an inability to resist expected lateral loads, which could lead to the deformation or detachment of cladding.

This is to limit the probability of precipitation ingress, which could lead to deterioration, which could lead to compromised structural integrity of the wall, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support or fastening for exterior cladding, which could lead to an inability to resist expected lateral loads, which could lead to the deformation or detachment of cladding.

This is to limit the probability of precipitation ingress, which could lead to deterioration, which could lead to compromised structural integrity of the wall, which could lead to:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support or fastening for exterior cladding, which could lead to an inability to resist expected lateral loads, which could lead to the deformation or detachment of cladding.

This is to limit the probability of:

- precipitation ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support or fastening for exterior cladding, which could lead to an inability to resist expected lateral loads, which could lead to the deformation or detachment of cladding.

This is to limit the probability of precipitation ingress, which could lead to deterioration, which could lead to:

- the excessive deflection and vibration of floors, which could lead to persons losing their balance, tripping or falling, or
- the excessive movement or deformation of walls, which could lead to compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support or fastening for exterior cladding, which could lead to an inability to resist expected lateral loads, which could lead to the deformation or detachment of cladding.

For exterior floors or environmental separators supporting a floor, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to excessive movement, vibration or deflection, which could lead to negative effects on the psychological well-being of persons.

---

**Provision: 9.23.17.2.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inappropriate specifications or rating of wall sheathing, which could lead to:

- an inadequate fastening base for cladding,
- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse, or
- the deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity of the wall or constructions supported by the wall.

This is to limit the probability of harm to persons.

---

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inappropriate specifications or rating of wall sheathing, which could lead to:

- an inadequate fastening base for cladding,
- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse, or
- the deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity of the wall or constructions supported by the wall.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, and
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inappropriate specifications or rating of wall sheathing, which could lead to:

- an inadequate fastening base for cladding,

- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inappropriate specifications or rating of wall sheathing, which could lead to:

- an inadequate fastening base for cladding,
- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inappropriate specifications or rating of wall sheathing, which could lead to:

- an inadequate fastening base for cladding,
- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

For exterior floors or environmental separators supporting a floor, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to excessive movement, vibration or deflection, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inappropriate specifications or rating of wall sheathing, which could lead to:

- an inadequate fastening base for cladding,
- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

For floors and elements supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- the displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of excessive deflection or vibration, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

**Provision: 9.23.17.3.(1)**

---

**Intent(s)**

*Intent 1.* To limit the application of Sentence 9.23.17.2.(1) and Table 9.23.17.2.-A so as to exclude sheathing materials that do not have an adequate capacity to hold fasteners.

**Provision: 9.23.17.4.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist expected lateral loads, which could lead to differential movement of sheathing board ends, which could lead to damage to cladding and the sheathing membrane, which could lead to:

- an inadequate fastening base for cladding,
- inadequate support for required cladding and elements of an environmental separator, or
- an inability to resist expected lateral or gravity loads, where sheathing provides the required resistance to racking and buckling.

This is to limit the probability of:

- falling cladding,
- the deformation or displacement of cladding, or
- the excessive deflection of the wall.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural collapse, or
- the deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity of the wall or constructions supported by the wall.

This is to limit the probability of harm to persons.

*Intent 1.* To limit the probability of an inability to accommodate dimensional changes due to variations in moisture content, which could lead to jamming of sheet edges, which could lead to buckling of cladding.

---

## **Intent Statements: NBC 2010**

For exterior floors or environmental separators supporting such a floor, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to excessive movement, vibration or deflection, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F80, F81-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate clearance, which could lead to an inability to accommodate dimensional changes due to variations in moisture content, which could lead to jamming of sheet edges, which could lead to buckling of cladding.

For exterior floors or environmental separators supporting such floors, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to excessive vibration or deflection, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.23.17.6.(1)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Articles 9.27.3.2. to 9.27.3.6. to include the lower portion of mansard roofs, which require a second line of defense against precipitation ingress.

---

### **Provision: 9.24.1.1.(1)**

---

### **Intent(s)**

*Intent 1.* To state the application of Section 9.24.

---

### **Provision: 9.24.1.1.(2)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Part 4 for the appropriate design criteria for loadbearing steel studs.

---

### **Provision: 9.24.1.2.(1)**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F22, F80-OP2.4]

[F20, F22, F80-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

**Intent 1.** To limit the probability that the performance of steel studs and runners, with respect to material, profile, dimensions and tolerances, cutouts, corrosion protection and screw-holding ability, will fall significantly below expectations, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

*Intent 1.* To limit the probability that the performance and physical properties of steel screws, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected lateral and gravity loads.

---

## **Intent Statements: NBC 2010**

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22, F80-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance and physical properties of steel screws, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance and physical properties of steel screws, with respect to withdrawal resistance, pull-through resistance or shear strength, will fall significantly below expectations, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.24.1.5.(1)**

**Objective**

OH1

**Attributions**

[F20, F22, F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate connection strength and stability, which could lead to an inability to resist expected lateral and gravity loads.

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F20, F22, F80-OS2.1]

[F20, F22, F80-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate connection strength and stability, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20, F22, F80-OP2.1, OP2.4]

[F20, F22, F80-OP2.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate connection strength and stability, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22, F80-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate connection strength and stability, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate connection strength and stability, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

---

## **Provision: 9.24.2.1.(1)**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4] [F22-OP2.4]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area, or excessive slenderness or spacing, which could lead to inadequate strength or rigidity.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to the structural failure of walls, which could lead to:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.4] [F22-OS2.4]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area, or excessive slenderness or spacing, which could lead to inadequate strength or rigidity.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to the structural failure of walls, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate cross-sectional area, or excessive slenderness or spacing, which could lead to inadequate strength or rigidity.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

---

**Provision: 9.24.2.2.(1)**

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4] [F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient strength or rigidity and inadequate support for fasteners.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to the structural failure of walls, which could lead to:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.4] [F22-OS2.4]

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient strength or rigidity and inadequate support for fasteners. This is to limit the probability of the excessive movement or deformation of walls, which could lead to the structural failure of walls, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient strength or rigidity and inadequate support for fasteners. This is to limit the probability of the excessive movement or deformation of walls, which could lead to compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

---

## **Provision: 9.24.2.3.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist expected lateral and gravity loads.

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.4]

[F22-OS2.4]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.24.2.4.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F20-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to forces exerted by the warping of rated doors under fire loads, which could lead to:

- the opening of such doors, or
- the opening of gaps between such doors and their frames.

This is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

### **Provision: 9.24.2.4.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F20-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to forces exerted by the warping of rated doors under fire loads, which could lead to:

- the opening of such doors, or
- the opening of gaps between such doors and their frames.

This is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

### **Provision: 9.24.2.4.(3)**

---

#### **Objective**

OS1

#### **Attributions**

[F20-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate side support for the frames of rated doors, which could lead to an inadequate resistance to forces exerted by the warping of rated doors under fire loads, which could lead to:

- the opening of such doors, or
- the opening of gaps between such doors and their frames.

This is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

**Provision: 9.24.2.4.(4)**

---

**Objective**

OS1

**Attributions**

[F20-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate top support for the frames of rated doors, which could lead to an inadequate resistance to forces exerted by the warping of rated doors under fire loads, which could lead to the opening of gaps between such doors and their frames.

This is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

**Provision: 9.24.2.5.(1)**

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected lateral and gravity loads.

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

[F20-OS2.1, OS2.3, OS2.4] [F22-OS2.3, OS2.4]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural failure of walls, or
- the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.4] [F22-OP2.3, OP2.4]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural failure of walls, or
- the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

---

**Provision: 9.24.3.1.(1)**

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate means to anchor wall assemblies to floors and ceilings, or inadequate means for the top and bottom attachment of cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads, which could lead to:

- misaligned top and bottom ends of studs, or
- the displacement of studs.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

[F20-OP2.1, OP2.4]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate means to anchor wall assemblies at openings, or inadequate means for the top and bottom attachment of cladding, sheathing or interior finish materials, which could lead to:

- misaligned top and bottom ends of studs, or
- the displacement of studs.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

**Objective**

OS3

**Attributions**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate means to anchor wall assemblies at openings, or inadequate means for the top and bottom attachment of cladding, sheathing or interior finish materials, which could lead to:

- misaligned top and bottom ends of studs, or
- the displacement of studs.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate means to anchor wall assemblies at openings, or inadequate means for the top and bottom attachment of cladding, sheathing or interior finish materials, which could lead to:

- misaligned top and bottom ends of studs, or
- the displacement of studs.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.24.3.2.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F21-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient clearance to accommodate the linear expansion of steel studs during a fire, which could lead to the buckling of studs, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

### **Provision: 9.24.3.2.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F21-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the connection of studs to top and bottom runners will be rigid, which could hinder the linear expansion of steel studs during a fire, which could lead to the buckling of studs, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

### **Provision: 9.24.3.2.(3)**

---

#### **Objective**

OS1

#### **Attributions**

[F20-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that framing will be of inadequate stiffness to resist forces exerted by the twisting of door frames on exposure to heat from a fire, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

### **Provision: 9.24.3.2.(4)**

---

#### **Objective**

OS1

#### **Attributions**

[F20-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate attachment of upper runners to studs, which could lead to framing of inadequate stiffness to resist forces exerted by the twisting of door frames on exposure to heat from a fire, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

**Provision: 9.24.3.2.(5)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to the conduction of heat through steel door frames, which could lead to an excessive rise in the temperature of steel framing members above doors during a fire, which could lead to the twisting or warping of runners, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

**Provision: 9.24.3.3.(1)**

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or stiffness, or an insufficient surface for the attachment of cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.4]

[F22-OS2.4]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or stiffness, or an insufficient surface for the attachment of cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or stiffness, or an insufficient surface for the attachment of cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or stiffness, or an insufficient surface for the attachment of cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or stiffness, or an insufficient surface for the attachment of cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

**Provision: 9.24.3.4.(1)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.4]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural failure of walls, or
- the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural failure of walls, or
- the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

For steel stud walls that support or are part of an environmental separator, this is to limit the probability of the excessive movement or deformation of walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- pollutant ingress,
- condensation, or
- precipitation ingress.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the inappropriate attachment of studs will lead to their becoming displaced, which could lead to the inappropriate attachment of studs to cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

For assemblies that are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assemblies, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the inappropriate attachment of studs will lead to their becoming displaced, which could lead to the inappropriate attachment of studs to cladding, sheathing or interior finish materials, which could lead to an inability to resist expected lateral and gravity loads.

This is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the structural failure of walls, or
- for exterior walls, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of compromised operation of doors or windows required for egress in an emergency, which could lead to harm to persons.

**Provision: 9.24.3.6.(2)**

---

**Objective**

OS1

**Attributions**

[F21-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that attaching steel studs to both the top and bottom runners will hinder the linear expansion of steel studs during a fire, which could lead to the buckling of studs, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

**Provision: 9.24.3.7.(1)**

---

**Objective**

OS1

**Attributions**

[F20-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the wall framing around fire dampers will have insufficient strength to support the dampers, which could lead to compromised operation of fire dampers in the event of a fire, which could lead to the breaching of fire-rated assemblies, which could lead to harm to persons.

**Provision: 9.24.3.7.(2)**

---

**Objective**

OS1

**Attributions**

[F20-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of joints, which could lead to the warping of steel sills or headers on exposure to heat from a fire, which could lead to the premature failure of the protecting membranes or compromised operation of fire dampers, which could lead to the breaching of fire-rated assemblies, which could lead to harm to persons.

**Provision: 9.24.3.7.(3)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to the conduction of heat from a fire damper casing to wall framing, which could lead to the distortion of the framing, which could lead to the premature failure of the damper, which could lead to the premature failure of fire-rated assemblies, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.25.1.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the scope of Section 9.25.

### **Provision: 9.25.1.1.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F63-OH1.1, OH1.2] [F55-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- excessively low temperatures of interior surfaces or within wall, ceiling or floor assemblies, which could lead to condensation,
- excessive air infiltration and exfiltration,
- excessive airborne vapour transfer from interior above ground and exterior below ground,
- precipitation ingress due to air pressure differences,
- uncontrolled diffusion of water vapour from air in heated space into insulated wall, ceiling and floor assemblies, which could lead to condensation,
- inadequate moisture diffusion, venting, or drainage of moisture to the exterior, which could lead to condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity, or water accumulation,
- pollutant ingress from the exterior, including combustion products from parking garages, or particulates,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F55, F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- excessively low temperatures of interior surfaces or within wall, ceiling or floor assemblies, which could lead to condensation,
- excessive air infiltration and exfiltration,
- excessive airborne vapour transfer from interior above ground and exterior below ground,
- precipitation ingress due to air pressure differences,
- uncontrolled diffusion of water vapour from air in heated space into insulated wall, ceiling and floor assemblies, which could lead to condensation,
- inadequate moisture diffusion, venting, or drainage of moisture to the exterior, which could lead to condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

**Intent(s)**

*Intent 1.* To direct Code users to:

- Subsection 9.25.2., which contains requirements for thermal insulation,
- Subsection 9.25.3., which contains requirements for air barrier systems,
- Subsection 9.25.4., which contains requirements for vapour barriers, and
- Subsection 9.25.5., which contains requirements for properties and relative position of all materials installed in the building envelope.

---

**Provision: 9.25.1.1.(3)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Sections 9.32. and 9.33., which contain requirements regarding the insulation and sealing of heating and ventilating ducts.

---

**Provision: 9.25.2.1.(1)**

---

**Objective**

OH1

**Attributions**

[F51, F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to control heat transfer through assemblies, which could lead to excessively low temperatures of interior surfaces, or within wall, ceiling or floor assemblies, which could lead to condensation.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to control heat transfer through assemblies, which could lead to excessively low temperatures of interior surfaces, or within wall, ceiling or floor assemblies, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

## **Provision: 9.25.2.2.(1)**

---

### **Objective**

OH1

### **Attributions**

[F51, F63, F80-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the thermal performance of required thermal insulation will fall significantly below expectations, which could lead to an inability to control heat transfer through assemblies, which could lead to:

- excessively low temperatures of interior surfaces or within assemblies, or
- condensation.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the thermal performance of required thermal insulation will fall significantly below expectations, which could lead to an inability to control heat transfer through assemblies, which could lead to excessively low temperatures of interior surfaces or within assemblies, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

**Provision: 9.25.2.2.(2)**

---

**Intent(s)**

*Intent 1.* To exempt thermal insulation from the application of the flame-spread rating requirements included in the standards referenced in Sentence 9.25.2.2.(1).

---

**Provision: 9.25.2.2.(3)**

---

**Objective**

OH1

**Attributions**

[F51, F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate thermal performance, which could lead to accelerated deterioration or compromised thermal resistance of the insulation, which could lead to excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate thermal performance, which could lead to accelerated deterioration or compromised thermal resistance of the insulation, which could lead to excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

### **Objective**

OS2

### **Attributions**

[F63, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that thermal insulation will be damaged by water, which could lead to a reduced thermal resistance, which could lead to excessive heat loss through portions of the building envelope, which could lead to excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

**Provision: 9.25.2.3.(5)**

**Objective**

OH1

**Attributions**

[F21-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that insufficient heat will reach the soil around foundations, which could lead to the freezing of soil, which could lead to frost-related soil movement, which could lead to cracking of footings, slabs-on-ground or building envelope assemblies supported by footings or slabs-on-ground.

This is to limit the probability of:

- condensation,
- precipitation ingress, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as or protected by environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F21-OS2.2, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that insufficient heat will reach the soil around foundations, which could lead to the freezing of soil, which could lead to frost-related soil movement, which could lead to cracking of footings, slabs-on-ground or building envelope assemblies supported by footings or slabs-on-ground.

This is to limit the probability of :

- the structural failure of footings and slabs-on-ground, or
- condensation, precipitation ingress or the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of supported assemblies acting as or protected by environmental separators.

This is to limit the probability of harm to persons.

#### **Objective**

OH1

#### **Attributions**

[F51, F63-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of installing loose-fill insulation in assemblies where the material is subject to:

- excessive settlement or displacement due to gravity and vibration,
- incomplete coverage, or
- moisture damage.

This is to limit the probability of compromised thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To facilitate the determination of compliance with this Code where fill levels of loose-fill insulation could be difficult to verify.

---

#### **Objective**

OS2

#### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of installing loose-fill insulation in assemblies where the material is subject to:

- excessive settlement or displacement due to gravity and vibration,
- incomplete coverage, or
- moisture damage.

This is to limit the probability of compromised thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

*Intent 2.* To facilitate the determination of compliance with this Code where fill levels of loose-fill insulation could be difficult to verify.

---

**Provision: 9.25.2.4.(2)**

---

**Objective**

OH1

**Attributions**

[F51-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessive settlement of, displacement of or incomplete coverage by loose-fill insulation, which could lead to inadequate thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies, or excessively high temperatures of roof surfaces.

This is to limit the probability of:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams, which could lead to water ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt loose-fill insulation from the application of Sentence 9.25.2.4.(1), in areas where the risk of excessive settlement, incomplete coverage and moisture damage is low.

---

**Objective**

OS2

**Attributions**

[F51-OS2.3]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of excessive settlement of, displacement of or incomplete coverage by loose-fill insulation, which could lead to inadequate thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies, or excessively high temperature of roof surfaces.

This is to limit the probability of:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams, which could lead to water ingress.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

*Intent 2.* To exempt loose-fill insulation from the application of Sentence 9.25.2.4.(1), in areas where the risk of excessive settlement, incomplete coverage and moisture damage is low.

---

### **Provision: 9.25.2.4.(3)**

#### **Intent(s)**

*Intent 1.* To expand the application of Sentence 9.25.2.4.(1) to include constructions where economical alternatives for insulation of such spaces are limited.

---

### **Provision: 9.25.2.4.(4)**

#### **Objective**

OS2

#### **Attributions**

9.25.2.4.(4)(a) [F21, F51-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the insulation will settle, which could lead to incomplete coverage by the insulation, which could lead to excessive heat loss through portions of the building envelope.

This is to limit the probability of excessively low temperatures of interior surfaces or within assemblies, which could lead to condensation.

This is to limit the probability deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

9.25.2.4.(4)(a) [F21, F51-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the insulation will settle, which could lead to incomplete coverage by the insulation, which could lead to excessive heat loss through portions of the building envelope.

This is to limit the probability of:

- excessively low temperatures of interior surfaces or within assemblies, or
- condensation.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Attributions**

9.25.2.4.(4)(b)

**Intent(s)**

*Intent 1.* To facilitate inspection for the purpose of determining compliance.

---

**Objective**

OS2

**Attributions**

9.25.2.4.(4)(c) [F81-OS2.1, OS2.3]

9.25.2.4.(4)(c) [F81-OS2.1, OS2.3, OS2.4, OS2.5] Applies where the interior finish provides the required bracing.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate fastening of or damage to the interior finish,
- inadequate protection of the insulation, air barrier system or vapour barrier, which could lead to condensation, or
- where the interior finish contributes to the required bracing, the inadequate performance of the interior finish, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- interior finishes becoming detached and falling,
- compromised structural integrity, which could lead to the structural collapse of wood-frame construction, or
- excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OH1

**Attributions**

9.25.2.4.(4)(c) [F81-OH1.1, OH1.2]

9.25.2.4.(4)(c) [F81-OH1.1, OH1.2, OH1.3] Applies where the interior finish provides the required bracing.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate protection of the insulation, air barrier system or vapour barrier, or

---

## **Intent Statements: NBC 2010**

- where the interior finish contributes to the required bracing, the inadequate performance of the interior finish, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures, drafts, relative humidity or water accumulation in interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

9.25.2.4.(4)(c) [F81-OP2.1, OP2.3, OP2.4, OP2.5] Applies where the interior finish provides to the required bracing.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate fastening of or damage to the interior finish,
- inadequate protection of the insulation, air barrier system or vapour barrier, which could lead to condensation, or
- where the interior finish contributes to the required bracing, the inadequate performance of the interior finish, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- interior finishes becoming detached and falling,
- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OP3

**Attributions**

9.25.2.4.(4)(c) [F81-OP3.1] Applies where the interior finish contributes to the required fire resistance of the wall.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate fastening of or damage to the interior finish,
- inadequate protection of the insulation, air barrier system or vapour barrier, which could lead to condensation, which could lead to deterioration of the assembly, or
- where the interior finish contributes to the required bracing, inadequate performance of the interior finish, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised fire resistance of the wall, which could lead to insufficient fire resistance, which could lead to the spread of fire from the building to an adjacent building during the time required for emergency responders to perform their duties.

This is to limit the probability of damage to the adjacent building.

---

**Objective**

OS3

**Attributions**

9.25.2.4.(4)(c) [F81-OS3.7] Applies where the interior finish provides the required bracing.

9.25.2.4.(4)(c) [F81-OS3.1] Applies where the interior finish provides the required bracing of walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate fastening of or damage to the interior finish, or
- inadequate protection of the insulation, air barrier system or vapour barrier, which could lead to condensation.

Where the interior finish contributes to the required bracing, this is to limit the probability of:

- the inadequate performance of the interior finish, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive movement or deformation of walls, or
- where the wall supports a floor, the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH4

### **Attributions**

9.25.2.4.(4)(c) [F81-OH4] Applies where the interior finish provides the required bracing of walls that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate fastening of or damage to the interior finish, or
- inadequate protection of the insulation, air barrier system or vapour barrier, which could lead to condensation.

Where the interior finish contributes to the required bracing, this is to limit the probability of:

- inadequate performance of the interior finish, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS2

### **Attributions**

9.25.2.4.(4)(d) [F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the addition of too much water, which could lead to moisture-related deterioration, which could lead to compromised structural integrity of the wall or elements supported by the wall, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

9.25.2.4.(4)(d) [F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the addition of too much water, which could lead to moisture-related deterioration, which could lead to compromised integrity of required environmental separation elements, which could compromise the performance of the environmental separator.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.25.2.4.(5)**

---

**Objective**

OH1

**Attributions**

[F51, F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies, which could lead to condensation, or
- the transfer of absorbed moisture into the masonry, which could lead to deterioration due to freeze-thaw stresses.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To modify the application of Sentence 9.25.2.4.(1) to include masonry cavity walls.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies, which could lead to condensation, or
- the transfer of absorbed moisture into the masonry, which could lead to deterioration due to freeze-thaw stresses.

This is to limit the probability of compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

*Intent 2.* To modify the application of Sentence 9.25.2.4.(1) to include masonry cavity walls.

**Provision: 9.25.2.4.(6)**

---

**Objective**

OH1

**Attributions**

9.25.2.4.(6)(a) [F51, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of:

- [Clause (a)] inadequate attic or roof space ventilation, and
- [Clause (b)] inadequate thermal resistance.

This is to limit the probability of:

- condensation, which could lead to the accumulation of moisture,
- the formation of ice dams, which could lead to the ingress of melted water,
- compromised thermal performance of components intended to provide resistance to heat transfer, or
- excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

9.25.2.4.(6)(a) [F62, F51-OS2.3]

9.25.2.4.(6)(b) [F51, F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- [Clause (a)] inadequate attic or roof space ventilation, and
- [Clause (b)] inadequate thermal resistance.

This is to limit the probability of:

- condensation, which could lead to the accumulation of moisture,
- the formation of ice dams, which could lead to the ingress of melted water,
- compromised thermal performance of components intended to provide resistance to heat transfer, or
- excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

### **Objective**

OH1

### **Attributions**

[F51, F41, F63-OH1.1] [F51, F63-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the installation of spray-applied polyurethane will fall significantly below expectations with regard to:

- spray equipment and operating parameters,
- chemicals or storage conditions,
- application procedures (including climatic conditions),
- physical properties (such as density, cohesion and adhesion), and
- substrate type, condition and preparation.

This is to limit the probability of:

- improperly constituted or applied polyurethane insulation, which could lead to the emission of gases, or
- inadequate thermal resistance, which could lead to excessively low temperatures of interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Provision: 9.25.3.3.(8)**

---

### **Intent(s)**

*Intent 1.* To clarify that Sentence 9.25.3.3.(6) applies to clearances between chimneys or gas vents and surrounding construction.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material by heat conducted or radiated from chimneys (especially during chimney fires), which could lead to harm to persons.

---

### **Provision: 9.25.3.4.(1)**

---

### **Objective**

OH1

### **Attributions**

[F40-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity between the materials installed to control the infiltration of air from the ground and the dampproofing (which serves as protection against the infiltration of air from the ground) on the exterior of the masonry wall, which could lead to air leakage, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

**Provision: 9.25.3.4.(2)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that masonry units without voids or flashing will be incorrectly installed, which could lead to discontinuity between the materials installed to control the infiltration of soil gas in a floor-on-ground and the dampproofing (which serves as protection against the infiltration of soil gas) on the exterior of the masonry wall, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

**Provision: 9.25.3.5.(1)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity between the waterproofing materials in the roof and the materials installed in the walls to protect against air leakage, which could lead to air leakage, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

**Provision: 9.25.3.6.(1)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of polyethylene used as an air barrier will fall significantly below expectations with respect to:

- air transfer resistance, or
- strength, flexibility, and resistance to tearing, puncturing, oxidation or ultraviolet radiation, which could lead to damage during installation, which could lead to an inadequate resistance to air leakage, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

---

**Intent Statements: NBC 2010****Provision: 9.25.3.6.(2)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate location of air barriers in floors-on-ground, which could lead to damage to air barriers, which could lead to the infiltration of soil gas (particularly radon), which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.25.3.6.(3)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.25.3.3.(2), which would otherwise require that joints be lapped not less than 100 mm, on the basis that the air barrier is installed below the floor-on-ground. This is to limit the probability of discontinuity in soil gas barriers, where they are weighed down by a concrete slab [which clamps the joints], which could lead to the infiltration of soil gas (particularly radon), which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.25.3.6.(4)**

---

**Intent(s)**

*Intent 1.* To expand the application of Article 9.25.3.3. to include the installation of air barriers in framed floors-on-ground or above floors-on-ground.

**Provision: 9.25.3.6.(5)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the use of an inappropriate sealant at the perimeter of floors-on-ground will lead to pollutant ingress from the exterior, including soil gas, combustion products from parking garages, or particulates, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.25.3.6.(6)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of air leakage, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.25.4.1.(1)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an uncontrolled diffusion of water vapour from air in heated space into insulated wall, ceiling and floor assemblies.

This is to limit the probability of:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an uncontrolled diffusion of water vapour from air in heated space into insulated wall, ceiling and floor assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.25.4.2.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive water vapour diffusion through vapour barriers, where the intended use of the interior space will not result in high moisture generation.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F63-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive water vapour diffusion through vapour barriers, which could lead to condensation.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Provision: 9.25.4.2.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Part 5 to Part 9 buildings.

---

#### **Objective**

OS2

#### **Attributions**

[F62, F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive water vapour diffusion, where the intended use of the interior space will result in high moisture generation, which could lead to condensation or water accumulation within the assembly.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of the assembly, or assemblies supported or protected by the environmental separator, which could lead to structural failure, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F62, F63-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessive water vapour diffusion, where the intended use of the interior space will result in high moisture generation, which could lead to condensation or water accumulation within the assembly.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of interior temperatures,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as or protected by environmental separators.

This is to limit the probability of:

- the inadequate thermal comfort of persons,
- negative effects on the air quality of indoor spaces, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.25.4.2.(3)**

---

**Objective**

OS2

**Attributions**

[F63, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of polyethylene installed to provide a high resistance to vapour movement will fall significantly below expectations with respect to:

- thermal stability,
- oxidation resistance, and
- ultraviolet light degradation.

This is to limit the probability of uncontrolled water vapour diffusion into insulated assemblies, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F63, F80-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of polyethylene installed to provide a high resistance to vapour movement will fall significantly below expectations with respect to:

- thermal stability,
- oxidation resistance, and
- ultraviolet light degradation.

This is to limit the probability of uncontrolled water vapour diffusion into insulated assemblies, which could lead to:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Provision: 9.25.4.2.(4)**

---

### **Objective**

OS2

### **Attributions**

[F63, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of membrane-type vapour barriers, other than polyethylene, will fall significantly below expectations with respect to:

- pliability,
- tensile strength,
- elongation under load, and
- water vapour permeance.

This is to limit the probability of uncontrolled water vapour diffusion into insulated assemblies, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F63, F80-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of membrane-type vapour barriers, other than polyethylene, will fall significantly below expectations with respect to:

- pliability,
- tensile strength,
- elongation under load, and
- water vapour permeance.

This is to limit the probability of uncontrolled water vapour diffusion into insulated assemblies, which could lead to:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Provision: 9.25.4.2.(5)**

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of coatings applied to gypsum board to function as a vapour barrier will fall significantly below expectations with respect to water vapour permeance, which could lead to uncontrolled water vapour diffusion into insulated assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F63-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of coatings applied to gypsum board to function as a vapour barrier will fall significantly below expectations with respect to water vapour permeance, which could lead to uncontrolled water vapour diffusion into insulated assemblies.

This is to limit the probability of:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Provision: 9.25.4.2.(6)**

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate thickness of foamed plastic insulation that also serves as the vapour barrier, which could lead to uncontrolled water vapour diffusion into insulated assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F63-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate thickness of foamed plastic insulation that also serves as the vapour barrier, which could lead to uncontrolled water vapour diffusion into insulated assemblies.

This is to limit the probability of:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Provision: 9.25.4.3.(1)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate coverage of wall, ceiling and floor assemblies with vapour barrier products, or
- vapour barrier installation at a plane in the building envelope where the temperature is sufficiently low to cause the condensation of water vapour from interior spaces on interior surfaces or within assemblies.

This is to limit the probability of uncontrolled water vapour diffusion into assemblies, which could lead to:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate coverage of wall, ceiling and floor assemblies with vapour barrier products, or
- vapour barrier installation at a plane in the building envelope where the temperature is sufficiently low to cause the condensation of water vapour from interior spaces on interior surfaces or within assemblies.

This is to limit the probability of uncontrolled water vapour diffusion into assemblies, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

### **Provision: 9.25.4.3.(2)**

#### **Objective**

OH1

#### **Attributions**

[F63-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that, where separate products are used for the vapour barrier and insulation, the location of the vapour barriers in the assembly is at a plane in the building envelope where the temperature is sufficiently low to cause the condensation of water vapour from interior spaces on interior surfaces or within assemblies.

This is to limit the probability of:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that, where separate products are used for the vapour barrier and insulation, the location of the vapour barriers in the assembly is at a plane in the building envelope where the temperature is sufficiently low to cause the condensation of water vapour from interior spaces on interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that, where the same product is used for the vapour barrier and insulation, the location of the vapour barriers in the assembly is at a plane in the building envelope where the temperature is sufficiently low to cause the condensation of water vapour from interior spaces on interior surfaces or within assemblies.

This is to limit the probability of condensation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that, where separate products are used for the vapour barrier and insulation, the location of the vapour barriers in the assembly is at a plane in the building envelope where the temperature is sufficiently low to cause the condensation of water vapour from interior spaces on interior surfaces or within assemblies.

This is to limit the probability of:

- condensation, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Provision: 9.25.5.1.(1)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To state, in part, the application of Article 9.25.5.2.

---

### **Provision: 9.25.5.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Part 5 to Part 9 buildings.

---

#### **Objective**

OS2

#### **Attributions**

[F62, F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture diffusion, venting, or drainage of moisture to the exterior, where the intended use of the interior space will result in high moisture generation, which could lead to condensation or water accumulation within the assembly.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of the assembly, or assemblies supported or protected by the environmental separator, which could lead to structural failure, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F62, F63-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture diffusion, venting, or drainage of moisture to the exterior, where the intended use of the interior space will result in high moisture generation, which could lead to condensation or water accumulation within the assembly.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of interior temperatures,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as or protected by environmental separators.

This is to limit the probability of:

- the inadequate thermal comfort of persons,
- negative effects on the air quality of indoor spaces, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.25.5.1.(3)**

---

#### **Intent(s)**

*Intent 1.* To exempt from the application of Clause 9.25.5.1.(1)(b) sheathing materials that have demonstrated—despite their lower air and vapour permeances—acceptable performance with respect to moisture dissipation.

---

**Provision: 9.25.5.2.(1)**

**Objective**

OS2

**Attributions**

[F62, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture diffusion, venting, or drainage of moisture to the exterior under normal interior conditions, which could lead to condensation.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of the assembly, or assemblies supported or protected by the environmental separator, which could lead to structural failure, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F62, F63-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture diffusion, venting, or drainage of moisture to the exterior under normal interior conditions, which could lead to condensation.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of interior temperatures,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as or protected by environmental separators.

This is to limit the probability of:

- the inadequate thermal comfort of persons,
- negative effects on the air quality of indoor spaces, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.25.5.2.(2)**

**Intent(s)**

*Intent 1.* To expand the application of the air space criteria stated in Clause 9.27.2.2.(1)(a) to air spaces required to be provided inboard of low air- and vapour-permeance cladding on walls (see Clause 9.25.5.2.(1)(c)).

---

## **Intent Statements: NBC 2010**

### **Provision: 9.26.1.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, which could lead to compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F61-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

### **Provision: 9.26.1.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the definition of roof for the purpose of the application of Section 9.26.

### **Provision: 9.26.1.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inappropriate application methods for asphalt shingles and accessories on roofs, which could lead to inadequate protection for roofs, which could lead to:

---

## **Intent Statements: NBC 2010**

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of roofing nails, with respect to material quality, gauge, head diameter, dimensional tolerances, finishes and coatings, will fall significantly below expectations, which could lead to:

- fracturing under bending forces,
- inadequate withdrawal resistance,
- pull-through at nail heads, which could lead to an inability to support roofing components and accessories, or
- corrosion on contact with water.

This is to limit the probability of inadequate fastening for roofing, which could lead to the displacement of roofing, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Attributions**

[F20, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- corrosion of staples on exposure to water from rain, or melting snow or ice, which could lead to failure under gravity, vibration and wind loads, or
- splitting of wood shingles or pull-through failure of asphalt shingles.

This is to limit the probability of the displacement of shingles, which could lead to precipitation or melt-water ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

**Provision: 9.26.2.3.(2)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate resistance to withdrawal from the substrate, and
- an inadequate contact area between the staple's crown and the shingle's surface, which could lead to excessive stressing of the staple/shingle interface, which could lead to pull-through failure.

This is to limit the probability of the displacement of shingles, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient slope of the roof or construction that serves as a roof, which could lead to inadequate drainage or water pooling, which could lead to:

- water accumulation, which could lead to damage to roofing material, which could lead to the premature failure of roofing, or
- water ingress at roofing joints.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of precipitation or meltwater ingress, which could lead to further deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

*Intent 2.* To supersede the application of Sentence 9.26.3.1.(1) to allow lower slopes where roofing material specifically designed for lower slopes will be used.

---

### **Objective**

OH1

### **Attributions**

[F61, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* For minimum slope requirements, to limit the probability of an insufficient slope of the roof or construction that serves as a roof, which could lead to inadequate drainage or water pooling, which could lead to:

- water accumulation, which could lead to damage to roofing material, which could lead to the deterioration of roofing, or
- water ingress at roofing joints.

This is to limit the probability of the premature failure of roofing, which could lead to precipitation or meltwater ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To supersede the application of Sentence 9.26.3.1.(1) to allow lower slopes where roofing material specifically designed for lower slopes will be used.

---

## **Provision: 9.26.3.1.(4)**

---

### **Objective**

OS2

### **Attributions**

[F61, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient positive slope of the roof or construction that serves as a roof, which could lead to inadequate drainage or water pooling, which could lead to:

- water accumulation, which could lead to damage to roofing material, which could lead to the deterioration of roofing, or
- water ingress at roofing joints.

This is to limit the probability of precipitation or meltwater ingress, which could lead to further deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient positive slope of the roof or construction that serves as a roof, which could lead to inadequate drainage or water pooling, which could lead to:

- water accumulation, which could lead to damage to roofing material, which could lead to the deterioration of roofing, or
- water ingress at roofing joints.

This is to limit the probability of the premature failure of roofing, which could lead to precipitation or meltwater ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.26.3.1.(5)**

---

**Objective**

OS2

**Attributions**

[F21-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient positive slope of the roof or construction that serves as a roof after shrinkage and loading of the building, which could lead to inadequate drainage or water pooling, which could lead to:

- water accumulation, which could lead to damage to roofing material, which could lead to the deterioration of roofing, or

---

## **Intent Statements: NBC 2010**

- water ingress at roofing joints.

This is to limit the probability of the premature failure of roofing, which could lead to precipitation or melt-water ingress, which could lead to further deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient positive slope of the roof or construction that serves as a roof after shrinkage and loading of the building, which could lead to inadequate drainage or water pooling, which could lead to:

- water accumulation, which could lead to damage to roofing material, which could lead to the deterioration of roofing, or
- water ingress at roofing joints.

This is to limit the probability of the premature failure of roofing, which could lead to precipitation or melt-water ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Provision: 9.26.4.1.(1)**

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.26.4.1.(2)**

---

**Intent(s)**

*Intent 1.* To expand the definition of roof for the purpose of the application of Sentence 9.26.4.1.(1).

**Provision: 9.26.4.2.(1)**

---

**Objective**

OH1

**Attributions**

[F61, F62, F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of flashing materials on exposure to moisture, sunlight, temperature extremes or mechanical stresses, which could lead to precipitation or meltwater ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs, or

---

## **Intent Statements: NBC 2010**

- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61, F62, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the premature failure of flashing materials on exposure to moisture, sunlight, temperature extremes or mechanical stresses, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

## **Provision: 9.26.4.3.(1)**

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate protection at valleys on shingled roofs, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate protection at valleys on shingled roofs, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.26.4.3.(2)**

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3] [F22-OS2.3, OS2.4]

**Intent(s)**

*Intent 1.* To limit the probability that roof sheathing will not be installed under valley flashing, which could lead to insufficient support of the flashing, which could lead to excessive deflection or failure of the roofing.

This is to limit the probability of compromised structural integrity, which could lead to precipitation ingress, which could lead to deterioration, which could lead to compromised structural integrity of roofs or assemblies protected by roofs, which could lead to structural failure, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that roof sheathing will not be installed under valley flashing, which could lead to insufficient support of the flashing, which could lead to excessive deflection or failure of the roofing.

This is to limit the probability of precipitation or meltwater ingress, which could lead to:

- compromised thermal performance of components intended to resist heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of environmental separators, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

OH1

#### **Attributions**

[F20, F61, F80-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

---

## **Intent Statements: NBC 2010**

- insufficient width, which could lead to water flowing down valleys, spreading horizontally beyond the edges of the flashing and penetrating the roof assembly, or
- inadequate flexibility, strength or durability, which could lead to damage under snow and impact loads or exposure to the elements.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20, F61, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- insufficient width, which could lead to water flowing down valleys, spreading horizontally beyond the edges of the flashing and penetrating the roof assembly, or
- inadequate flexibility, strength or durability, which could lead to damage under snow and impact loads or exposure to the elements.

This is to limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

### **Provision: 9.26.4.3.(5)**

---

### **Objective**

OH1

### **Attributions**

[F20, F61, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that valley flashing, in combination with the top layer required by Sentence 9.26.4.3.(6), will be unable to resist structural and environmental loads (such as those imposed by foot traffic, UV exposure, snow accumulation, ice damming, rain and freeze-thaw cycling), which could lead to the displacement of roofing.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20, F61, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that valley flashing, in combination with the top layer required by Sentence 9.26.4.3.(6), will be unable to resist structural and environmental loads (such as those imposed by foot traffic, UV exposure, snow accumulation, ice damming, rain and freeze-thaw cycling), which could lead to the displacement of roofing.

This is to limit the probability of:

- falling roofing materials, or
- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs.

This is to limit the probability of harm to persons.

---

## **Provision: 9.26.4.3.(6)**

---

### **Objective**

OH1

### **Attributions**

[F20, F61, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that valley flashing, in combination with the bottom layer required by Sentence 9.26.4.3.(5), will be unable to resist structural and environmental loads (such as those imposed by foot traffic, UV exposure, snow accumulation, ice damming, rain and freeze-thaw cycling), which could lead to the displacement of roofing.

This is to limit the probability of:

- precipitation or meltwater ingress, or

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F61, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that valley flashing, in combination with the bottom layer required by Sentence 9.26.4.3.(5), will be unable to resist structural and environmental loads (such as those imposed by foot traffic, UV exposure, snow accumulation, ice damming, rain and freeze-thaw cycling), which could lead to the displacement of roofing.

This is to limit the probability of:

- falling roofing materials, or
- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs.

This is to limit the probability of harm to persons.

---

**Provision: 9.26.4.4.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,

---

## **Intent Statements: NBC 2010**

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Intent 2.** Where the intersection is between a shingle roof and a chimney, to limit the probability of precipitation or meltwater ingress, which could lead to damage to chimney liners from freeze-thaw stresses, which could lead to flue gases leaking into living space, which could lead to negative effects on the air quality of indoor spaces [see analysis for Sentence 9.21.4.6.(1)].

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

**Intent 1.** To limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs, masonry walls or chimneys, or elements protected by such assemblies, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F61-OS1.1] Applies where a shingle roof intersects with a masonry *chimney*.

### **Intent(s)**

**Intent 1.** Where the intersection is between a shingle roof and a chimney, to limit the probability of precipitation or meltwater ingress into chimneys, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons [see analysis for Sentence 9.21.4.6.(1)].

---

### **Objective**

OP1

### **Attributions**

[F61-OP1.1] Applies where a shingle roof intersects with a masonry *chimney*.

### **Intent(s)**

**Intent 1.** Where the intersection is between a shingle roof and a chimney, to limit the probability of precipitation or meltwater ingress into chimneys, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building [see analysis for Sentence 9.21.4.6.(1)].

---

**Objective**

OS3

**Attributions**

[F61-OS3.4] Applies where a shingle roof intersects with a masonry *chimney*.

**Intent(s)**

*Intent 1.* Where the intersection is between a shingle roof and a chimney, to limit the probability of precipitation or meltwater ingress into chimneys, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the premature failure of chimney liners, which could lead to carbon monoxide gas leaking into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.26.4.4.(2)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- water running down the face of masonry and entering behind primary flashing, or
- the intersection being unable to accommodate differential vertical movement of chimneys and roof surfaces, which could lead to the displacement of or damage to flashing.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* Where counter flashing is installed between a shingle roof and a chimney, to limit the probability of precipitation or meltwater ingress, which could lead to damage to chimney liners from freeze-thaw stresses, which could lead to flue gases leaking into living space, which could lead to negative effects on the air quality of indoor spaces [see analysis for Sentence 9.21.4.6.(1)].

**Provision: 9.26.4.4.(4)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient upwards extension of flashing, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* Where the roof slopes upwards from a masonry chimney, to limit the probability of precipitation or meltwater ingress, which could lead to damage to chimney liners from freeze-thaw stresses, which could lead to flue gases leaking into living space, which could lead to negative effects on the air quality of indoor spaces [see analysis for Sentence 9.21.4.6.(1)].

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or walls, or elements protected by such assemblies, which could lead to harm to persons.

---

**Provision: 9.26.4.5.(2)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- temporary ponding of water, or
- where the sheathing membrane does not overlap the vertical leg of the flashing, water descending on the face of the sheathing membrane and behind the flashing.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- cracking, tearing or shrinking of built-up roof membranes (when returned up walls at a sharp angle),
- interruption of roofing membranes at junctions with walls or chimneys, or
- water temporarily ponding and eventually overtopping cant strips.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* Where the intersection is between a built-up roof and a chimney, to limit the probability of precipitation or meltwater ingress, which could lead to damage to chimney liners from freeze-thaw stresses, which could lead to the premature failure of chimney liners, which could lead to flue gases leaking into living space, which could lead to negative effects on the air quality of indoor spaces [see analysis for Sentence 9.21.4.6.(1)].

[F61-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that the flow of water down a roof's surface will be interrupted by a wide chimney, which could lead to a temporary increase in water depth beyond the depth protected by roofing or by the vertical leg of flashing at the chimney, which could lead to precipitation or meltwater ingress, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the premature failure of chimney liners, which could lead to carbon monoxide gas leaking into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.26.4.8.(2)**

---

**Objective**

OH1

**Attributions**

[F20, F81-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of chimney saddles under expected structural or environmental loads, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of precipitation or meltwater ingress, which could lead to damage to chimney liners from freeze-thaw stresses, which could lead to flue gases leaking into living space, which could lead to negative effects on the air quality of indoor spaces [see analysis for Sentence 9.21.4.6.(1)], which could lead to harm to persons.

## **Provision: 9.26.4.8.(3)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or chimneys, or elements protected by such assemblies, which could lead to harm to persons.

---

**Provision: 9.26.4.8.(4)**

**Intent(s)**

*Intent 1.* To expand the application of Article 9.26.4.4. to include the intersections between chimney saddles and masonry chimneys.

---

**Provision: 9.26.4.8.(5)**

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To exempt situations from the application of Sentence 9.26.4.8.(1) where sufficient protection is provided by flashing and counter flashing.

*Intent 2.* To limit the probability that the flow of water down a roof's surface will be interrupted by a wide chimney, which could lead to a temporary increase in water depth beyond the depth protected by roofing or by the vertical leg of flashing at the chimney, which could lead to:

- precipitation or meltwater ingress, or

---

## **Intent Statements: NBC 2010**

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To exempt situations from the application of Sentence 9.26.4.8.(1) where sufficient protection is provided by flashing and counter flashing.

*Intent 2.* To limit the probability that the flow of water down a roof's surface will be interrupted by a wide chimney, which could lead to a temporary increase in water depth beyond the depth protected by roofing or by the vertical leg of flashing at the chimney, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or chimneys, or elements protected by such assemblies, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F61-OS1.1]

### **Intent(s)**

*Intent 1.* To exempt situations from the application of Sentence 9.26.4.8.(1) where sufficient protection is provided by flashing and counter flashing.

*Intent 2.* To limit the probability that the flow of water down a roof's surface will be interrupted by a wide chimney, which could lead to a temporary increase in water depth beyond the depth protected by roofing or by the vertical leg of flashing at the chimney, which could lead to precipitation or meltwater ingress, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons [see analysis for Sentence 9.21.4.6.(1)].

---

### **Objective**

OP1

### **Attributions**

[F61-OP1.1]

**Intent(s)**

*Intent 1.* To exempt situations from the application of Sentence 9.26.4.8.(1) where sufficient protection is provided by flashing and counter flashing.

*Intent 2.* To limit the probability that the flow of water down a roof's surface will be interrupted by a wide chimney, which could lead to a temporary increase in water depth beyond the depth protected by roofing or by the vertical leg of flashing at the chimney, which could lead to precipitation or meltwater ingress, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building [see analysis for Sentence 9.21.4.6.(1)].

---

**Objective**

OS3

**Attributions**

[F61-OS3.4]

**Intent(s)**

*Intent 1.* To exempt situations from the application of Sentence 9.26.4.8.(1) where sufficient protection is provided by flashing and counter flashing.

*Intent 2.* To limit the probability that the flow of water down a roof's surface will be interrupted by a wide chimney, which could lead to a temporary increase in water depth beyond the depth protected by roofing or by the vertical leg of flashing at the chimney, which could lead to precipitation or meltwater ingress, which could lead to damage to masonry or to chimney liners from freeze-thaw stresses, which could lead to the premature failure of chimney liners, which could lead to carbon monoxide gas leaking into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.26.4.8.(6)**

---

**Intent(s)**

*Intent 1.* To expand the application of Sentence 9.26.4.4.(2) to include the intersections of masonry chimneys and roofing, which are exempted from the requirement to have a chimney saddle installed because adequate protection is provided by flashing and counter flashing.

---

**Provision: 9.26.5.1.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate protection of the roof area where water is being retained near the eaves by ice dams or where heat transferred through the ceiling below causes snow to melt and ice dams to form.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate protection of the roof area where water is being retained near the eaves by ice dams or where heat transferred through the ceiling below causes snow to melt and ice dams to form.

This is to limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

### **Provision: 9.26.5.1.(2)**

### **Intent(s)**

*Intent 1.* To exempt constructions from the application of Sentence 9.26.5.1.(1), which would otherwise require eave protection, where:

- the probability of ice-dam formation is low,
- the vulnerable area is beyond the point likely to be reached by ponded water,
- asphalt shingles are installed in a manner that reduces the roof's vulnerability to ice-dam-related leakage, or
- the roof slope is sufficiently steep to facilitate speedy drainage and minimize the likelihood of ponding.

---

### **Provision: 9.26.5.2.(1)**

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inappropriate materials or installation of eave protection, which could lead to tearing or puncturing of such materials.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inappropriate materials or installation of eave protection, which could lead to tearing or puncturing of such materials, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

**Provision: 9.26.6.1.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- moisture-permeable underlay absorbing and retaining water, or
- water- and vapour-impermeable underlay providing a surface where condensation can accumulate in roof spaces.

This is to limit the probability of long-term wetting of roof decking or sheathing, which could lead to damage to roofing, which could lead to:

- condensation,
- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- moisture-permeable underlay absorbing and retaining water, or
- water- and vapour-impermeable underlay providing a surface where condensation can accumulate in roof spaces.

This is to limit the probability of long-term wetting of roof decking or sheathing, which could lead to damage to roofing, which could lead to:

- condensation, or
- precipitation or meltwater ingress.

This is to limit the probability of deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

## **Provision: 9.26.6.1.(2)**

---

### **Objective**

OH1

### **Attributions**

[F62-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of insufficiently moisture-permeable underlay, which could lead to moisture (from leakage or condensation) collecting on the upper surface of underlay, which could lead to long-term wetting of shingles, which could lead to:

- condensation,
- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F62-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of insufficiently moisture-permeable underlay, which could lead to moisture (from leakage or condensation) collecting on the upper surface of underlay, which could lead to long-term wetting of shingles, which could lead to:

- condensation, or
- precipitation or meltwater ingress.

This is to limit the probability of deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

**Provision: 9.26.6.2.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the retention of water that has penetrated roofing or that has condensed on the underside of underlay, which could lead to long-term wetting of sheathing, which could lead to deterioration, which could lead to further:

- condensation,
- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- further deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the retention of water that has penetrated roofing or that has condensed on the underside of underlay, which could lead to long-term wetting of sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate head lap, which could lead to precipitation or meltwater ingress, which could lead to water penetrating directly to roof decking or sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or walls or of assemblies protected by roofs or walls, which could lead to harm to persons.

---

## **Provision: 9.26.7.4.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20, F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate number of fasteners, which could lead to an inability to resist uplift forces from wind, vibration and gravity, or
- exposed fasteners, which could lead to the shrinkage and tearing of shingles over time.

This is to limit the probability of:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or walls or of assemblies protected by roofs or walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate number of fasteners, which could lead to an inability to resist uplift forces from wind, vibration and gravity, or
- exposed fasteners, which could lead to the shrinkage and tearing of shingles over time.

This is to limit the probability of water penetrating directly to roof decking or sheathing.

This is to limit the probability of:

- roofing detaching and falling, or
- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or walls or of assemblies protected by roofs or walls.

This is to limit the probability of harm to persons.

---

**Provision: 9.26.7.4.(2)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate bearing area between the staple's crown and the shingle's surface, which could lead to excessive stress on the staple/shingle interface, which could lead to pull-through, or
- an inadequate resistance to withdrawal from the substrate.

This is to limit the probability of the displacement of shingles, which could lead to:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or walls or of assemblies protected by roofs or walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To supersede the requirement for 4 fasteners stated in Sentences 9.26.2.3.(2) and 9.26.7.4.(1), and increase the number of fasteners to 6 for constructions where relatively narrow staples are used.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an excessive number or inappropriate location of defects (such as knots, holes, decay, shake, wane and checks, crimps and the presence of sapwood), which could lead to a reduction in the watertightness of shingles exposed to the weather, which could lead to water penetrating directly to roof decking or sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

## **Provision: 9.26.9.3.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- if shingles were too short, insufficient overlap of wood shingles at the desired exposure, which could lead to an insufficient number of shingle plies over the roof surface, which could lead to coinciding defects,
- if shingles were too narrow, splitting, exposed joints or defects in underlying courses at joints between shingles or shakes, or
- if shingles were too wide, shrinkage and cracking.

This is to limit the probability of:

- water penetrating directly to roof decking or sheathing, or

---

## **Intent Statements: NBC 2010**

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- if shingles were too short, insufficient overlap of wood shingles at the desired exposure, which could lead to an insufficient number of shingle plies over the roof surface, which could lead to coinciding defects,
- if shingles were too narrow, splitting, exposed joints or defects in underlying courses at joints between shingles or shakes, or
- if shingles were too wide, shrinkage and cracking.

This is to limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

### **Provision: 9.26.9.4.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- jamming and buckling, cracking or dislodgement of wood shingles, or
- aligned joints in succeeding courses.

This is to limit the probability of:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

This is to limit the probability of water penetrating directly to roof decking or sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

## **Provision: 9.26.9.5.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- if not enough fasteners were used, the displacement of shingles under wind-uplift and gravity loads,
- if too many fasteners were used, the splitting of shingles under loads imposed by the shrinkage of shingles, or
- if fasteners were exposed to water, corrosion, which could lead to a reduction in the fasteners' ability to resist expected loads, which could lead to the displacement of shingles.

This is to limit the probability of:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- excessive exposure of the shortest shingles, which could lead to insufficient overlap, which could lead to an insufficient number of shingle plies over the roof surface, which could lead to coinciding defects, or
- excessive exposure, which could lead to excessive unsupported length, which could lead to an increased vulnerability to displacement due to wind.

This is to limit the probability of rain or meltwater penetrating directly to roof decking or sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

### **Provision: 9.26.9.7.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.26.4., which contains requirements for flashing.

---

### **Provision: 9.26.9.8.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.26.5., which contains requirements for eave protection.

---

### **Provision: 9.26.10.1.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- insufficient length, which could lead to an insufficient overlap of wood shakes at the maximum exposure permitted, which could lead to an insufficient number of shake plies over the roof surface, which could lead to coinciding defects,
- insufficient width or shrinkage and cracking of excessively wide wood shakes, which could lead to an excessive number and proximity of cracks or joints, which could lead to relatively short paths for water penetration past shingles, or
- significant differences in the thickness of shakes, which could lead to the ingress of wind-driven rain or snow through gaps.

This is to limit the probability of:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Objective**

OS2

## **Attributions**

[F61-OS2.3]

## **Intent(s)**

*Intent 1.* To limit the probability of:

- insufficient length, which could lead to an insufficient overlap of wood shakes at the maximum exposure permitted, which could lead to an insufficient number of shake plies over the roof surface, which could lead to coinciding defects,
- insufficient width or shrinkage and cracking of excessively wide wood shakes, which could lead to an excessive number and proximity of cracks or joints, which could lead to relatively short paths for water penetration past shingles, or
- significant differences in the thickness of shakes, which could lead to the ingress of wind-driven rain or snow through gaps.

This is to limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate resistance to water absorption, freeze-thaw cycling, UV exposure or other deleterious environmental loads, which could lead to the premature failure of built-up roof membranes, or
- built-up roofs with inadequate tensile strength, which could lead to splitting and tearing of the membranes under traffic loads and movement of the building structure.

This is to limit the probability of:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F61, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that performance will fall significantly below expectations with respect to substrate preparation, protective separation sheets, application of PVC membrane, membrane flashing and inspection.

This is to limit the probability of premature failure, which could lead to:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that performance will fall significantly below expectations with respect to substrate preparation, protective separation sheets, application of PVC membrane, membrane flashing and inspection, which could lead to premature failure, which could lead to precipitation or meltwater ingress, which could lead to water penetrating directly to roof decking or sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

**Provision: 9.26.17.1.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that performance will fall significantly below expectations with respect to materials, underlayment, counter battens, flashing, battens, attic ventilation, tiling procedures, bedding, caulking and closures.

This is to limit the probability of premature failure, which could lead to:

- water penetrating directly to roof decking or sheathing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Intent(s)**

*Intent 1.* To limit the probability that performance will fall significantly below expectations with respect to materials, underlayment, counter battens, flashing, battens, attic ventilation, tiling procedures, bedding and caulking, which could lead to premature failure, which could lead to water penetrating directly to roof decking or sheathing, which could lead to deterioration, which could lead to the structural failure of roofs or assemblies protected by roofs, which could lead to harm to persons.

---

### **Provision: 9.26.18.1.(1)**

### **Intent(s)**

*Intent 1.* To direct Code users to Part 7, which contains requirements for plumbing systems.

---

### **Provision: 9.26.18.2.(1)**

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- the ingress of water into basements, or
- soil erosion, which could lead to negative effects on grading near foundations, which could lead to the flow of surface runoff toward foundations.

This is to limit the probability of overloading dampproofing or drainage systems, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of relative humidity, temperatures of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs or assemblies protected by roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- the ingress of water into basements, or
- soil erosion, which could lead to negative effects on grading near foundations, which could lead to the flow of surface runoff toward foundations.

This is to limit the probability of overloading dampproofing or drainage systems, which could lead to:

- precipitation or meltwater ingress, or
- moisture ingress from the ground into or through assemblies.

This is to limit the probability of deterioration, which could lead to the structural failure of foundation walls or elements protected by foundation walls, which could lead to harm to persons.

---

**Provision: 9.27.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state, in part, the application of Subsection 9.27.2. to Subsection 9.27.12.

*Intent 2.* To expand the application of Part 5 to exterior wall coverings of lumber, wood shingles, shakes, fibre-cement shingles, planks and sheets, plywood, oriented strandboard, waferboard, hardboard, vinyl, aluminum and steel, including related trim and soffits, where these are not installed according to Subsections 9.27.2. to 9.27.12.

---

**Provision: 9.27.1.1.(2)**

---

**Intent(s)**

*Intent 1.* To state, in part, the application of Subsection 9.27.2., Subsection 9.27.3. and Subsection 9.27.4.

*Intent 2.* To cross-reference Section 9.28.

*Intent 3.* To expand the application of Part 5 to exterior wall coverings of stucco, where these are not installed according to Subsection 9.27.2. to 9.27.12. and Section 9.28.

---

**Provision: 9.27.1.1.(3)**

---

**Intent(s)**

*Intent 1.* To state, in part, the application of Subsection 9.27.2. to Subsection 9.27.4.

*Intent 2.* To cross-reference Section 9.20.

*Intent 3.* To expand the application of Part 5 to masonry serving as cladding on wood-frame or masonry walls exposed to precipitation, where it is not installed according to Subsection 9.27.2. to Subsection 9.27.4. and Section 9.20.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.27.1.1.(4)**

---

#### **Intent(s)**

*Intent 1.* To state, in part, the application of Subsection 9.27.2. to Subsection 9.27.4. and Subsection 9.26.7.

*Intent 2.* To expand the application of the installation requirements for asphalt shingle roofing stated in Subsection 9.26.7. to asphalt shingle cladding.

*Intent 3.* To expand the application of Part 5 to asphalt shingles serving as cladding on wood-frame walls exposed to precipitation, where these are not installed according to Subsection 9.27.2. to Subsection 9.27.4. and Subsection 9.26.7.

### **Provision: 9.27.1.1.(5)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Part 5 to include cladding materials and their installation on substrates that are not addressed in Section 9.20., 9.27. or 9.28., or in Subsection 9.26.7.

### **Provision: 9.27.2.1.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F61-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

This is to limit the probability of deterioration, which could lead to structural failure of exterior walls or elements supported or protected by exterior walls, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the ingress of water into interior spaces, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or

- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.27.2.1.(2)**

---

**Objective**

OS2

**Attributions**

[F80, F81-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that environmental separators will deteriorate at an unacceptable rate, which could lead to their premature failure, which could lead to:

- precipitation or meltwater ingress, or
- condensation.

This is to limit the probability of deterioration of the building structure, which could lead to structural failure of exterior walls or elements supported or protected by exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F80, F81-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that environmental separators will deteriorate at an unacceptable rate, which could lead to their premature failure, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures, drafts, relative humidity or water accumulation in interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.27.2.2.(1)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To define assemblies that are deemed to provide a capillary break between the cladding and backing assembly in walls.

### **Provision: 9.27.2.2.(2)**

---

#### **Intent(s)**

*Intent 1.* To identify allowable interruptions in drained and vented air spaces or drainage material installed to provide a capillary break between the cladding and backing assembly in exterior walls.

### **Provision: 9.27.2.2.(3)**

---

#### **Objective**

OS2

#### **Attributions**

[F62-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that moisture will transfer from drained and vented air space or drainage material in the wall into assemblies above the wall, which could lead to the accumulation of moisture.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that moisture will transfer from drained and vented air space or drainage material in the wall into assemblies above the wall, which could lead to the accumulation of moisture.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of roofs and ceilings acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.27.2.2.(4)**

---

**Objective**

OS2

**Attributions**

[F61, F62-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or an inadequate dissipation of moisture from behind the cladding.

This is to limit the probability of deterioration, which could lead to structural failure of exterior walls or elements supported or protected by exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or an inadequate dissipation of moisture from behind the cladding.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the ingress of water into interior spaces, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.27.2.2.(5)**

---

**Objective**

OS2

**Attributions**

[F61, F62-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or an inadequate dissipation of moisture from behind the cladding.

This is to limit the probability of deterioration, which could lead to structural failure of exterior walls or elements supported or protected by exterior walls, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or an inadequate dissipation of moisture from behind the cladding.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the ingress of water into interior spaces, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.27.2.2.(6)**

---

### **Intent(s)**

*Intent 1.* To exempt exterior walls from the requirement to install a capillary break, where:

- lesser protection will not adversely affect the performance of building assemblies,
- damage to the building will have limited adverse consequences,
- the walls, and intersecting or supported floors, are not susceptible to moisture damage, or
- other methods are used to minimize moisture ingress.

---

### **Provision: 9.27.2.3.(1)**

---

### **Objective**

OS2

### **Attributions**

[F61, F62-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress
  - through the first and second planes of protection,
  - at penetrations through the first and second planes of protection, and
  - at interfaces with other wall assemblies, and

- an inadequate dissipation to the exterior of precipitation or meltwater that does bypass the first plane of protection.

This is to limit the probability of deterioration, which could lead to structural failure of exterior walls or elements supported or protected by exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress
  - through the first and second planes of protection,
  - at penetrations through the first and second planes of protection, and
  - at interfaces with other wall assemblies, and
- an inadequate dissipation to the exterior of precipitation or meltwater that does bypass the first plane of protection.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the ingress of water into interior spaces, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.27.2.4.(1)**

---

**Objective**

OS2

**Attributions**

[F61, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that precipitation or meltwater will splash, soak or pool against the lower portions of cladding, which could lead to the accelerated deterioration and premature failure of cladding.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to structural failure,
- falling cladding components, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), an inability of the cladding to resist lateral loads, which could lead to racking of exterior walls, which could lead to
  - the deformation of the building, or
  - the displacement of cladding, trim and flashing, the opening of joints or the failure of caulking, which could lead to precipitation or meltwater ingress, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F61, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that precipitation or meltwater will splash, soak or pool against the lower portions of cladding, which could lead to the accelerated deterioration and premature failure of cladding.

This is to limit the probability of precipitation or meltwater ingress, which could lead to:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.27.3.4.(1)**

**Intent(s)**

*Intent 1.* To limit the application of Sentence 9.27.3.3.(1), in constructions where insulating sheathing can provide the protection against air infiltration and precipitation ingress normally required of sheathing membranes.

*Intent 2.* To state the application of Sentence 9.27.3.4.(2).

**Provision: 9.27.3.4.(2)**

---

**Objective**

OS2

**Attributions**

[F61, F55-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate sealing to prevent moisture ingress or of inappropriate detailing at joints, which could lead to:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F55-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate sealing to prevent moisture ingress or of inappropriate detailing at joints, which could lead to:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- compromised thermal performance of components intended to resist heat transfer, which could lead to an inadequate control of the temperature of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.27.3.5.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F61, F55-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of installation or in-service damage to a single unsupported layer of sheathing membrane, which could lead to:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F61, F55-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of installation or in-service damage to a single unsupported layer of sheathing membrane, which could lead to:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- compromised thermal performance of components intended to resist heat transfer, which could lead to an inadequate control of the temperature of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

### **Provision: 9.27.3.5.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F61, F55-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate clamping or tear resistance at overlapped joints, which could lead to an inability to resist expected wind loads, which could lead to damage to the membrane, which could lead to:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F55-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate clamping or tear resistance at overlapped joints, which could lead to an inability to resist expected wind loads, which could lead to damage to the membrane, which could lead to:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- compromised thermal performance of components intended to resist heat transfer, which could lead to an inadequate control of the temperature of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.27.3.5.(3)**

---

**Intent(s)**

*Intent 1.* To clarify the application of Sentence 9.23.17.2.(1).

---

**Provision: 9.27.3.6.(1)**

---

**Intent(s)**

*Intent 1.* To limit the application of Sentence 9.27.3.3.(1), in constructions where the cladding provides the required protection against air infiltration and precipitation ingress, and where:

- the building occupants do not necessarily expect more durable building assemblies, or
- the building is not subject to particularly high exterior moisture loads.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To state the application of Sentence 9.27.3.6.(2) and 9.27.3.6.(3).

### **Provision: 9.27.3.6.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F20, F61, F55-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls, which could lead to harm to persons.

*Intent 2.* To clarify the application of Sentence 9.27.3.6.(1).

---

#### **Objective**

OH1

#### **Attributions**

[F20, F61, F55-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of the failure of required environmental separation elements, which could lead to compromised thermal performance of components intended to resist heat transfer, which could lead to:

- an inadequate control of the temperature of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To clarify the application of Sentence 9.27.3.6.(1).

**Provision: 9.27.3.6.(3)**

---

**Objective**

OS2

**Attributions**

[F61, F55-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation ingress, or
- excessive air infiltration or “wind-washing,” which could lead to condensation or excessive heat transfer.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls, which could lead to harm to persons.

*Intent 2.* To clarify the application of Sentence 9.27.3.6.(1).

---

**Objective**

OH1

**Attributions**

[F61, F55-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

**Objective**

OS2

**Attributions**

[F61, F62, F80-OS2.3]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of:

- installing flashing with inadequate water resistance, and
- the premature failure of flashing materials on exposure to moisture, sunlight, temperature extremes or mechanical stresses.

This is to limit the probability of inadequate protection for exterior walls, which could lead to:

- precipitation or meltwater ingress, and
- an inadequate dissipation of precipitation or meltwater to the exterior.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F61, F62, F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- installing flashing with inadequate water resistance, and
- the premature failure of flashing materials on exposure to moisture, sunlight, temperature extremes or mechanical stresses.

This is to limit the probability of inadequate protection for exterior walls, which could lead to:

- precipitation or meltwater ingress, and
- an inadequate dissipation of precipitation or meltwater to the exterior.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.27.3.8.(1)**

### **Objective**

OS2

### **Attributions**

9.27.3.8.(1)(a), 9.27.3.8.(1)(b), 9.27.3.8.(1)(c)(i) [F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress at horizontal joints and offsets in cladding.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

9.27.3.8.(1)(a), 9.27.3.8.(1)(b), 9.27.3.8.(1)(c)(i) [F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress at horizontal joints and offsets in cladding.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

9.27.3.8.(1)(c)(ii) [F61, F62-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

9.27.3.8.(1)(c)(ii) [F61, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.27.3.8.(2)**

---

#### **Objective**

OS2

#### **Attributions**

9.27.3.8.(2)(a), 9.27.3.8.(2)(b)(ii), 9.27.3.8.(2)(c)(i) [F61-OS2.3] Applies to detailing of horizontal joints.

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress at horizontal joints between cladding elements.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

*Intent 2.* To limit the application of Sentence 9.27.3.8.(1), where the wall assembly is constructed such that:

- precipitation or meltwater ingress at horizontal joints will be minimized, or
- moisture that bypasses the cladding will be dissipated.

---

#### **Objective**

OH1

#### **Attributions**

9.27.3.8.(2)(a), 9.27.3.8.(2)(b)(ii), 9.27.3.8.(2)(c)(i) [F61-OH1.1, OH1.2, OH1.3] Applies to detailing of horizontal joints.

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress at horizontal joints between cladding elements.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Intent 2.** To limit the application of Sentence 9.27.3.8.(1), where the wall assembly is constructed such that:

- precipitation or meltwater ingress at horizontal joints will be minimized, or
- moisture that bypasses the cladding will be dissipated.

---

**Objective**

OS2

**Attributions**

9.27.3.8.(2)(b)(i), 9.27.3.8.(2)(c)(ii) [F61, F62-OS2.3] Applies to cladding installed outboard of a drained and vented air space.

**Intent(s)**

**Intent 1.** To limit the probability of an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

**Intent 2.** To limit the application of Sentence 9.27.3.8.(1), where the wall assembly is constructed such that:

- precipitation or meltwater ingress at horizontal joints will be minimized, or
- moisture that bypasses the cladding will be dissipated.

---

**Objective**

OH1

**Attributions**

9.27.3.8.(2)(b)(i), 9.27.3.8.(2)(c)(ii) [F61, F62-OH1.1, OH1.2, OH1.3] Applies to cladding installed outboard of a drained and vented air space.

**Intent(s)**

**Intent 1.** To limit the probability of an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Intent 2.** To limit the application of Sentence 9.27.3.8.(1), where the wall assembly is constructed such that:

- precipitation or meltwater ingress at horizontal joints will be minimized, or

---

## **Intent Statements: NBC 2010**

- moisture that bypasses the cladding will be dissipated.

---

### **Provision: 9.27.3.8.(3)**

#### **Objective**

OS2

#### **Attributions**

[F61, F62-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress at the heads of openings through cladding, and
- an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress at the heads of openings through cladding, and
- an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.27.3.8.(4)**

#### **Objective**

OS2

#### **Attributions**

[F61, F62-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate up-stand inboard of the sheathing membrane or sheathing installed in lieu of the sheathing membrane,
- inadequate slope to the exterior,
- lack of end dams or inadequate height of end dams,
- inadequate lap over the building element below, and
- lack of a drip or inadequate offset of the drip from the face of the building element below.

This is to limit the probability of precipitation or meltwater ingress, or an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate up-stand inboard of the sheathing membrane or sheathing installed in lieu of the sheathing membrane,
- inadequate slope to the exterior,
- lack of end dams or inadequate height of end dams,
- inadequate lap over the building element below, and
- lack of a drip or inadequate offset of the drip from the face of the building element below.

This is to limit the probability of:

- precipitation or meltwater ingress at openings through cladding, and
- an inadequate dissipation of precipitation or meltwater to the exterior, which could lead to the excessive accumulation of moisture.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of unsealed joints at points not protected by roof overhangs or flashing, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of unsealed joints at points not protected by roof overhangs or flashing, which could lead to precipitation or meltwater ingress into building structures, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

**Provision: 9.27.4.1.(2)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress at unsealed joints, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress at unsealed joints, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress at unsealed vertical joints, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress at unsealed vertical joints, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

**Provision: 9.27.4.2.(1)**

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of the sealant joint under expected loads, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of the sealant joint under expected loads, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

**Provision: 9.27.4.2.(2)**

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of sealant materials will fall significantly below expectations, which could lead to the premature failure of sealed joints, which could lead to:

- precipitation or meltwater ingress, or

---

## **Intent Statements: NBC 2010**

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of sealant materials will fall significantly below expectations, which could lead to the premature failure of sealed joints, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

## **Provision: 9.27.4.2.(3)**

---

### **Objective**

OH1

### **Attributions**

[F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of sealant backing will fall significantly below expectations with respect to

- absorption properties and off-gassing of the sealant backing material
- resisting permanent deformation

This is to limit the probability of three-sided adhesion of sealants, which could lead to excessive movement of the backside of the sealant between substrates, which could lead to the premature failure of sealant joints, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of sealant backing will fall significantly below expectations with respect to

- absorption properties and off-gassing of the sealant backing material
- resisting permanent deformation

This is to limit the probability of three-sided adhesion of sealants, which could lead to excessive movement of the backside of the sealant between substrates, which could lead to the premature failure of sealant joints, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

**Attributions**

[F20-OS2.1, OS2.3]

[F20-OS2.1, OS2.3, OS2.4] [F22-OS2.3, OS2.4, OS2.5] Applies where panel-type cladding is installed to provide the required bracing.

**Intent(s)**

*Intent 1.* To limit the probability of fastening cladding to an inappropriate substrate.

This is to limit the probability of:

- an inadequate resistance to expected gravity loads and lateral wind loads, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), an inadequate resistance to expected lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of:

- the displacement of cladding, trim and flashing, the opening of joints or the failure of caulking, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls,
- falling cladding components, or

---

## **Intent Statements: NBC 2010**

- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), structural failure.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.4] [F22-OP2.3, OP2.4, OP2.5] Applies where panel-type cladding is installed to provide the required bracing.

### **Intent(s)**

*Intent 1.* To limit the probability of fastening cladding to an inappropriate substrate.

Where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), this is to limit the probability of an inadequate resistance to lateral loads, which could lead to racking of exterior walls, which could lead to:

- the deformation of the building, or
- the displacement of cladding, trim and flashing, the opening of joints or the failure of caulking, which could lead to precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where panel-type cladding is installed to provide the required bracing.

### **Intent(s)**

*Intent 1.* To limit the probability of fastening cladding to an inappropriate substrate.

This is to limit the probability of:

- an inadequate resistance to expected gravity loads and lateral wind loads, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), an inadequate resistance to expected lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of:

- the displacement of cladding, trim and flashing, the opening of joints or the failure of caulking, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), the displacement or failure of other required environmental separation elements.

This is to limit the probability of:

- precipitation or meltwater ingress, or

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies where panel-type cladding is installed to provide the required bracing of walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of fastening cladding to an inappropriate substrate.

Where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), this is to limit the probability of an inadequate resistance to lateral loads, which could lead to racking of exterior walls, which could lead to:

- inadequate support of supported environmental separation elements, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

Where exterior walls support floors, this is to limit the probability of the deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies where panel-type cladding is installed to provide the required bracing of walls that support floors.

[F20, F22-OS3.7] Applies where panel-type cladding is installed to provide required bracing of walls that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of fastening cladding to an inappropriate substrate.

Where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), this is to limit the probability of an inadequate resistance to lateral loads, which could lead to racking of exterior walls, which could lead to:

- compromised structural integrity, or

---

## **Intent Statements: NBC 2010**

- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of supported floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

[F20-OS2.1, OS2.3]

[F20-OS2.1, OS2.3, OS2.4] [F22-OS2.3, OS2.4, OS2.5] Applies where panel-type cladding is installed to provide the required bracing.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to:

- gravity loads and lateral wind loads, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- falling cladding components.

This is to limit the probability of harm to persons.

**Provision: 9.27.5.5.(1)**

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that fasteners will deteriorate at an unacceptable rate, which could lead to the premature failure of fasteners.

This is to limit the probability of an inadequate resistance to:

- gravity loads and lateral wind loads, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

## **Provision: 9.27.7.4.(1)**

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of water, from rain or melted snow running down the face of cladding, entering joints between shingles or shakes, and penetrating the cladding assembly through corresponding joints between shingles or shakes in lower courses.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

- edge joints becoming misaligned or pulling away from trim and flashing, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), edge joints becoming misaligned, which could lead to an inability to resist lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- falling cladding components.

This is to limit the probability of harm to persons.

## **Intent Statements: NBC 2010**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3, OP2.4] [F22-OP2.3, OP2.4, OP2.5] Applies where panel-type cladding is installed to provide the required bracing.

### **Intent(s)**

*Intent 1.* To limit the probability of warping or buckling on exposure to water, which could lead to:

- edge joints becoming misaligned or pulling away from trim and flashing, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), edge joints becoming misaligned, which could lead to an inability to resist lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- falling cladding components.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

### **Provision: 9.27.8.4.(2)**

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of panel edges jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling, which could lead to the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20-OP2.1, OP2.3, OP2.4] [F22-OP2.3, OP2.4, OP2.5] Applies where panel-type cladding is installed to provide the required bracing.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- warping or buckling on exposure to water, which could lead to:
  - edge joints becoming misaligned or pulling away from trim and flashing, or
  - where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), edge joints becoming misaligned, which could lead to an inability to resist lateral loads, which could lead to racking of exterior walls, or
- panel edges jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling.

This is to limit the probability of:

- the deformation of the building, or
- the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:
  - precipitation or meltwater ingress, which could lead to deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, or
  - falling cladding components.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

## **Provision: 9.27.9.3.(2)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress at vertical butt joints between hardboard cladding panels, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or

- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

## **Intent Statements: NBC 2010**

### **Provision: 9.27.10.3.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of panel edges jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling.

This is to limit the probability of:

- the excessive deformation, displacement or cracking of cladding, the opening of joints or the failure of caulking, or
- where support spacing does not exceed 400 mm and panel-type plywood cladding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), an inability to resist lateral loads, which could lead to racking of exterior walls, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F21-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of panel edges jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling.

This is to limit the probability of the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- falling cladding components.

This is to limit the probability of harm to persons.

**Provision: 9.27.10.3.(3)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

**Provision: 9.27.10.3.(4)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to effectively shed water, which could lead to:

- precipitation or meltwater ingress, or

---

## **Intent Statements: NBC 2010**

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to effectively shed water, which could lead to precipitation or meltwater ingress between panels, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

## **Provision: 9.27.10.4.(1)**

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of cladding jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling, which could lead to:

- the displacement of cladding, trim and flashing, opening of joints or failure of caulking, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), insufficient strength to resist lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F21-OS2.1, OS2.3]

[F21-OS2.1, OS2.3, OS2.4, OS2.5] Applies where panel-type cladding is installed to provide the required bracing.

**Intent(s)**

*Intent 1.* To limit the probability of cladding jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling, which could lead to:

- the displacement of cladding, trim and flashing, opening of joints or failure of caulking, or
- where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), insufficient strength to resist lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- falling cladding components.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F21-OP2.1, OP2.3, OP2.4, OP2.5] Applies where panel-type cladding is installed to provide the required bracing.

**Intent(s)**

*Intent 1.* Where panel-type siding is installed as bracing to satisfy Subclause 9.23.13.1.(2)(a)(i) and Clause 9.23.13.6.(1)(a), to limit the probability of cladding jamming upon linear expansion due to an increase in moisture content from exposure to precipitation, which could lead to buckling, which could lead to insufficient strength to resist lateral loads, which could lead to racking of exterior walls.

This is to limit the probability of:

- the deformation of the building, or
- the displacement of cladding, trim and flashing, opening of joints or failure of caulking, which could lead to:

---

## **Intent Statements: NBC 2010**

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to compromised structural integrity of exterior walls or elements protected by exterior walls, or
- falling cladding components.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, or
- damage to the building.

---

### **Provision: 9.27.11.1.(1)**

#### **Objective**

OH1

#### **Attributions**

[F20, F22, F61, F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of horizontal and vertical strip steel siding and associated flashing, trim accessories will fall significantly below expectations, which could lead to:

- premature failure, or
- an inability to effectively shed water.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- the accumulation of water in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F21-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength to resist the stresses induced by the thermal expansion and contraction of masonry chimneys, which could lead to the delamination or cracking of stucco under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco provides required protection from precipitation, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20, F21-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength to resist the stresses induced by the thermal expansion and contraction of masonry chimneys, which could lead to the delamination or cracking of stucco under gravity, wind or impact loads, or freeze-thaw stresses.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of chimneys, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F20, F21-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength to resist the stresses induced by the thermal expansion and contraction of masonry chimneys, which could lead to the delamination or cracking of stucco under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco provides required protection from precipitation, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OP1

**Attributions**

[F20, F21-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength to resist the stresses induced by the thermal expansion and contraction of masonry chimneys, which could lead to the delamination or cracking of stucco under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco provides required protection from precipitation, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [See intent for Sentence 9.21.4.6.(1).]

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of:

- stresses on stucco due to shrinkage of the masonry substrate during curing, or
- the inadequate bonding of stucco due to the excessively high moisture content of masonry.

This is to limit the probability of the delamination or cracking of stucco, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- stresses on stucco due to shrinkage of the masonry substrate during curing, or
- the inadequate bonding of stucco due to the excessively high moisture content of masonry.

This is to limit the probability of the delamination or cracking of stucco, which could lead to:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F80-OS1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- stresses on stucco due to shrinkage of the masonry substrate during curing, or
- the inadequate bonding of stucco due to the excessively high moisture content of masonry.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape

of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F80-OS3.4] Applies where stucco is applied to masonry *chimneys*.

**Intent(s)**

*Intent 1.* To limit the probability of:

- stresses on stucco due to shrinkage of the masonry substrate during curing, or
- the inadequate bonding of stucco due to the excessively high moisture content of masonry.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

[F80-OP1.1] Applies where stucco is applied to masonry *chimneys*.

**Intent(s)**

*Intent 1.* To limit the probability of:

- stresses on stucco due to shrinkage of the masonry substrate during curing, or
- the inadequate bonding of stucco due to the excessively high moisture content of masonry.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [See intent for Sentence 9.21.4.6.(1).]

---

**Provision: 9.28.1.4.(1)**

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of water splashing back from the ground and penetrating stucco, which could lead to:

- precipitation or meltwater ingress into the sheathing and framing, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

---

## **Intent Statements: NBC 2010**

- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of water splashing back from the ground and penetrating stucco, which could lead to precipitation or meltwater ingress into the sheathing and framing, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, which could lead to harm to persons.

---

## **Provision: 9.28.1.5.(1)**

---

### **Objective**

OH1

### **Attributions**

[F80-OH1.1, OH1.2, OH1.3] Applies to the separation of aluminum flashing from stucco.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to shed water effectively, or
- with respect to the separation of aluminum flashing from stucco, a chemical reaction between aluminum flashing and stucco, which could lead to the accelerated deterioration of aluminum flashing material, which could lead to an inability to shed water.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To direct Code users to Subsections 9.27.3. and 9.27.4., which contain requirements for the materials, location, and installation of flashing and caulking for stucco.

---

**Objective**

OS2

**Attributions**

[F80-OS2.3] Applies to the separation of aluminum flashing from stucco.

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to shed water effectively, or
- a chemical reaction between aluminum flashing and stucco, which could lead to the accelerated deterioration of aluminum flashing material, which could lead to an inability to shed water.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

*Intent 2.* To direct Code users to Subsections 9.27.3. and 9.27.4., which contain requirements for the materials, location, and installation of flashing and caulking for stucco.

---

**Provision: 9.28.2.1.(1)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of cement will fall significantly below expectations, which could lead to the stucco being of inadequate strength, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of cement will fall significantly below expectations, which could lead to the stucco being of inadequate strength, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of cement will fall significantly below expectations, which could lead to the stucco being of inadequate strength, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.4] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of cement will fall significantly below expectations, which could lead to the stucco being of inadequate strength, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OP1

### **Attributions**

[F20-OP1.1] Applies where stucco is applied to masonry *chimneys*.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of cement will fall significantly below expectations, which could lead to the stucco being of inadequate strength, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [F20-OS3.4] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate withdrawal resistance, which could lead to the withdrawal of nails or staples, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OP1

### **Attributions**

[F20-OP1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate withdrawal resistance, which could lead to the withdrawal of nails or staples, which could lead to delamination or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [See intent for Sentence 9.21.4.6.(1).]

---

## **Provision: 9.28.3.2.(4)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate withdrawal resistance, which could lead to inadequate support for stucco to resist gravity loads, which could lead to delamination or cracking under gravity loads or freeze-thaw stresses, which could lead to stucco detaching and falling from the building, which could lead to harm to persons.

**Provision: 9.28.4.1.(1)**

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessive corrosion, which could lead to inadequate support for stucco or swelling of expanded metal stucco mesh, which could lead to delamination, disintegration or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessive corrosion, which could lead to inadequate support for stucco or swelling of expanded metal stucco mesh, which could lead to delamination, disintegration or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F80-OS1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive corrosion, which could lead to inadequate support for stucco or swelling of expanded metal stucco mesh, which could lead to delamination, disintegration or cracking under gravity, wind or impact loads, or freeze-thaw stresses.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate backing support, which could lead to inadequate strength to resist impact or other lateral loads, which could lead to the deformation or cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt constructions from the application of Sentence 9.28.1.1.(1), where adequate backing support is provided by other means.

---

**Objective**

OS2

**Attributions**

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate backing support, which could lead to inadequate strength to resist impact or other lateral loads, which could lead to the deformation or cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt constructions from the application of Sentence 9.28.1.1.(1), where adequate backing support is provided by other means.

---

**Provision: 9.28.4.3.(1)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist shrinkage or lateral forces, which could lead to the deformation or cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist shrinkage or lateral forces, which could lead to the deformation or cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist shrinkage or lateral forces, which could lead to the deformation or cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.4] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength, which could lead to an inability to resist shrinkage or lateral forces, which could lead to the deformation or cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OP1

---

**Objective**

OH1

**Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate embedment of lath in stucco, which could lead to the deformation or cracking of stucco due to excessive shrinkage.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate embedment of lath in stucco, which could lead to the deformation or cracking of stucco due to excessive shrinkage.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

## **Provision: 9.28.4.5.(3)**

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of concentrations of stress at aligned end joints or inadequate anchorage of end joints, which could lead to the cracking of stucco due to shrinkage, or gravity or lateral loads.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of concentrations of stress at aligned end joints or inadequate anchorage of end joints, which could lead to the cracking of stucco due to shrinkage, or gravity or lateral loads.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

**Provision: 9.28.4.5.(4)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to concentrations of stress under impact loads and the excessive shrinkage of stucco at corners, which could lead to the cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to concentrations of stress under impact loads and the excessive shrinkage of stucco at corners, which could lead to the cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to concentrations of stress under impact loads and the excessive shrinkage of stucco at corners, which could lead to the cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.4] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to concentrations of stress under impact loads and the excessive shrinkage of stucco at corners, which could lead to the cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OP1

### **Attributions**

[F20-OP1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to concentrations of stress under impact loads and the excessive shrinkage of stucco at corners, which could lead to the cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [See intent for Sentence 9.21.4.6.(1).]

---

## **Provision: 9.28.4.6.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.27.5. [specifically Sentence 9.27.5.1.(2)], which contains requirements regarding sheathing as a substrate for attaching stucco lath.

**Provision: 9.28.4.6.(2)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity and lateral loads, which could lead to the detachment of lath, which could lead to the cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity and lateral loads, which could lead to the detachment of lath, which could lead to the cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

[F20-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity and lateral loads, which could lead to the detachment of lath, which could lead to the cracking of stucco.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt constructions from the application of Sentence 9.28.4.6.(2), where an alternative acceptable nailing pattern is used.

### **Intent(s)**

*Intent 1.* To limit the probability of the incomplete curing of stucco, which could lead to inadequate strength to resist gravity, lateral, impact or abrasion loads, or freeze-thaw stresses, which could lead to the cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OP1

### **Attributions**

[F20, F80-OP1.1] Applies where stucco is applied to masonry *chimneys*.

### **Intent(s)**

*Intent 1.* To limit the probability of the incomplete curing of stucco, which could lead to inadequate strength to resist gravity, lateral, impact or abrasion loads, or freeze-thaw stresses, which could lead to the cracking of stucco.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [See intent for Sentence 9.21.4.6.(1).]

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate resistance to moisture diffusion, or
- the extensive cracking of stucco due to excessive shrinkage.

This is to limit the probability of:

- excessive moisture transfer by capillary action, or
- inadequate strength to resist gravity, lateral, impact or abrasion loads, or freeze-thaw stresses.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inadequate resistance to moisture diffusion, or

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the dislodgement of stones from the stucco surface, which could lead to an inadequate resistance to abrasion or freeze-thaw stresses, which could lead to delamination.

This is to limit the probability of:

- precipitation or meltwater ingress, which could lead to deterioration, which could lead to the structural failure of exterior walls or elements protected by exterior walls, or
- stucco detaching and falling from the building.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F80-OS1.1] Applies where stucco is applied to masonry *chimneys*.

**Intent(s)**

*Intent 1.* To limit the probability of the dislodgement of stones from the stucco surface, which could lead to an inadequate resistance to abrasion or freeze-thaw stresses, which could lead to delamination.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F80-OS3.4] Applies where stucco is applied to masonry *chimneys*.

**Intent(s)**

*Intent 1.* To limit the probability of the dislodgement of stones from the stucco surface, which could lead to an inadequate resistance to abrasion or freeze-thaw stresses, which could lead to delamination.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OP1

**Attributions**

[F80-OP1.1] Applies where stucco is applied to masonry *chimneys*.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of the dislodgement of stones from the stucco surface, which could lead to an inadequate resistance to abrasion or freeze-thaw stresses, which could lead to delamination.

Where stucco is applied to masonry chimneys, this is to limit the probability of precipitation or meltwater ingress, which could lead to the premature failure of chimney liners, which could lead to the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building. [See intent for Sentence 9.21.4.6.(1).]

---

### **Provision: 9.29.1.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Section 9.29.

*Intent 2.* To direct Code users to Sections 9.10. and 9.11., which contain additional requirements that might apply to the finishes described in this Section.

---

### **Provision: 9.29.2.1.(1)**

#### **Objective**

OH1

#### **Attributions**

[F80, F81-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- exposure of moisture-vulnerable interior finishes to water, which could lead to the ingress of water into wall assemblies, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of interior finishes, which could lead to compromised integrity of exterior walls or elements protected by exterior walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F80, F81-OS2.3]

#### **Intent(s)**

**Intent 1.** To limit the probability of exposure of moisture-vulnerable interior finishes to water, which could lead to the ingress of water into wall assemblies.

This is to limit the probability of the deterioration of interior finishes, which could lead to studs being unable to resist expected impact, gravity or lateral loads, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F80, F81-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

**Intent 1.** To limit the probability of exposure of moisture-vulnerable interior finishes to water, which could lead to the ingress of water into wall assemblies, which could lead to the deterioration of interior finishes.

This is to limit the probability of:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F80, F81-OP2.3, OP2.4]

**Intent(s)**

**Intent 1.** To limit the probability of exposure of moisture-vulnerable interior finishes to water, which could lead to the ingress of water into wall assemblies.

This is to limit the probability of the deterioration of interior finishes, which could lead to studs being unable to resist expected impact, gravity or lateral loads, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.29.2.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F80, F81-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

#### **Intent(s)**

*Intent 1.* To limit the probability of repeated water exposure of moisture-vulnerable interior finishes, which could lead to the deterioration of interior finishes.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the further deterioration of interior finishes.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F80-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of repeated water exposure of moisture-vulnerable interior finishes.

This is to limit the probability of the deterioration of interior finishes, which could lead to studs being unable to resist expected impact, gravity or lateral loads, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F80-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of repeated water exposure of moisture-vulnerable interior finishes, which could lead to the deterioration of interior finishes.

This is to limit the probability of:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F80-OP2.3, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of repeated water exposure of moisture-vulnerable interior finishes.

This is to limit the probability of the deterioration of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

**Provision: 9.29.3.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20, F22-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads, which could lead to splitting, excessive deflection, bending failure or the withdrawal of fasteners.

This is to limit the probability of:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or

---

## **Intent Statements: NBC 2010**

- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads, which could lead to splitting, excessive deflection, bending failure or the withdrawal of fasteners.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of interior finishes.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads, which could lead to splitting, excessive deflection, bending failure or the withdrawal of fasteners.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F22-OP2.1, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads, which could lead to splitting, excessive deflection, bending failure or the withdrawal of fasteners.

This is to limit the probability of:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.29.5.4.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient strength, which could lead to an inability to resist expected gravity loads, which could lead to the excessive sagging of gypsum board.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- the excessive deformation, displacement or failure of environmental separation elements (such as insulation), which could lead to deterioration, which could lead to compromised structural integrity of the assembly, or
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure.

This is to limit the probability of harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient strength, which could lead to an inability to resist expected gravity loads, which could lead to the excessive sagging of gypsum board.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to failure or compromised performance of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of insufficient strength, which could lead to an inability to resist expected gravity loads, which could lead to the excessive sagging of gypsum board.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F20, F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient strength, which could lead to an inability to resist expected gravity loads, which could lead to the excessive sagging of gypsum board.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- the excessive deformation, displacement or failure of environmental separation elements (such as insulation), which could lead to deterioration, which could lead to compromised structural integrity of the assembly, or
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, and
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where interior finishes contribute to the required bracing or lateral support for studs, or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, or
- where interior finishes support or serve as required environmental separation elements, the deformation or detachment of interior finishes.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or contribute to the required fire resistance of assemblies.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies where walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

Where walls support floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1, OS3.7] Applies where walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to:

- persons losing their balance, tripping or falling, and
- delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Objective**

OP3

**Attributions**

[F20-OP3.1] Applies where interior finishes are installed to contribute to the required fire resistance of exterior walls.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes are installed to contribute to the required fire resistance of exterior walls, to limit the probability of the deformation or detachment of interior finishes, which could lead to a loss of fire resistance.

This is to limit the probability of compromised fire resistance of walls, which could lead to insufficient fire resistance, which could lead to the spread of fire from the building to an adjacent building during the time required for emergency responders to perform their duties.

This is to limit the probability of damage to adjacent buildings.

---

**Objective**

OP1

**Attributions**

[F20-OP1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of compromised fire resistance of interior finishes, which could lead to insufficient fire resistance, which could lead to the growth and spread of fire, which could lead to damage to the building.

### **Provision: 9.29.5.8.(5)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20-OS2.5] [F22-OS2.4, OS2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OS2.3] Applies where interior finishes support or serve as required environmental separation elements.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

[F20-OP2.5] [F22-OP2.4, OP2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OP2.3] Applies where interior finishes support or serve as required environmental separation elements.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where interior finishes contribute to the required bracing or lateral support for studs, or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of :

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, or
- where interior finishes support or serve as required environmental separation elements, the deformation or detachment of interior finishes.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies where walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

Where walls support floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1, OS3.7] Applies where walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F20-OP1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of compromised fire resistance of interior finishes, which could lead to insufficient fire resistance, which could lead to the growth and spread of fire, which could lead to damage to the building.

---

**Objective**

OP3

**Attributions**

[F20-OP3.1] Applies where interior finishes are installed to contribute to the required fire resistance of exterior walls.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to--where interior finishes are installed to contribute to the required fire resistance of exterior walls--a loss of fire resistance.

This is to limit the probability of compromised fire resistance of walls, which could lead to insufficient fire resistance, which could lead to the spread of fire from the building to an adjacent building during the time required for emergency responders to perform their duties.

This is to limit the probability of damage to adjacent buildings.

**Provision: 9.29.5.8.(6)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.5] [F22-OS2.4, OS2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OS2.3] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that gypsum board will be crushed, which could lead to inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

[F20, F22-OS2.3] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20-OP2.5] [F22-OP2.4, OP2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OP2.3] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,

---

## **Intent Statements: NBC 2010**

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, and
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where interior finishes contribute to the required bracing or lateral support for studs, or where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, or
- where interior finishes support or serve as required environmental separation elements, the deformation or detachment of interior finishes.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1, OS3.7] Applies where the walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to:

- persons losing their balance, tripping or falling, and
- delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies where the walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

---

## **Intent Statements: NBC 2010**

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

Where walls support floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OP3

### **Attributions**

[F20-OP3.1] Applies where interior finishes are installed to contribute to the required fire resistance of exterior walls.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes are installed to contribute to the required fire resistance of exterior walls, to limit the probability of the deformation or detachment of interior finishes, which could lead to a loss of fire resistance.

This is to limit the probability of compromised fire resistance of walls, which could lead to insufficient fire resistance, which could lead to the spread of fire from the building to an adjacent building during the time required for emergency responders to perform their duties.

This is to limit the probability of damage to adjacent buildings.

---

### **Objective**

OP1

### **Attributions**

[F20-OP1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of compromised fire resistance of interior finishes, which could lead to insufficient fire resistance, which could lead to the growth and spread of fire, which could lead to damage to the building.

---

## **Provision: 9.29.5.9.(5)**

---

### **Intent(s)**

*Intent 1.* To exempt wall finishes whose fire-resistance rating is determined based on Table A-9.10.3.1.-A in Appendix A from the application of Sentence 9.29.5.9.(4), with respect to fire protection.

**Provision: 9.29.5.9.(6)**

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.5] [F22-OS2.4, OS2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OS2.3] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20-OP2.5] [F22-OP2.4, OP2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OP2.3] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where interior finishes contribute to the required bracing or lateral support for studs, or where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, or
- where interior finishes support or serve as required environmental separation elements, the deformation or detachment of interior finishes.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20-OH4] Applies where walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, or

- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

Where walls support floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1, OS3.7] Applies where walls support floors and where interior finishes contribute to the required bracing or lateral support for studs or where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for gypsum board, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

[F20-OP2.1] [F20, F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or

---

## **Intent Statements: NBC 2010**

- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Provision: 9.29.6.1.(2)**

#### **Intent(s)**

*Intent 1.* To clarify to what accuracy thickness measurements must be made.

---

### **Provision: 9.29.6.1.(3)**

#### **Intent(s)**

*Intent 1.* To exempt constructions from the application of Sentence 9.29.6.1.(1), where the plywood interior finish is continuously supported.

---

### **Provision: 9.29.6.2.(1)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F20, F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,

---

## **Intent Statements: NBC 2010**

- compromised operation of doors or windows, or
- damage to the building.

---

### **Provision: 9.29.6.2.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.29.6.2.(1) plywood finishes that are supported at right angles to the face ply, where the grooves will not weaken the plywood finish more than grooves conforming to Sentence 9.29.6.2.(1).

---

### **Provision: 9.29.6.3.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F20, F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for plywood interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, and
- damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.29.6.3.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for plywood interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for plywood interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, and
- damage to the building.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for plywood interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for plywood interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for plywood interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inadequate fastening for plywood interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Intent(s)**

*Intent 1.* To direct Code users to Sentence 9.23.3.5.(2)

---

### **Provision: 9.29.6.4.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate edge support, which could lead to inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or

- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Provision: 9.29.9.2.(5)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.4, OS2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OS2.3] Applies where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

*Intent 1.* To limit the probability of installing interior finishes of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling of finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1]

[F20-OP2.5] [F22-OP2.4, OP2.5] Applies where interior finishes contribute to the required bracing or lateral support for studs.

[F20, F22-OP2.3] Applies where interior finishes support or serve as required environmental separation elements.

### **Intent(s)**

**Intent 1.** To limit the probability of installing interior finishes of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- falling finishes,
- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or serve as required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where interior finishes support or serve as required environmental separation elements, or where interior finishes contribute to the required bracing of exterior walls.

**Intent(s)**

**Intent 1.** To limit the probability of installing interior finishes of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of:

- where interior finishes contribute to the required bracing of exterior walls, the buckling or racking of walls, or
- where interior finishes support or serve as required environmental separation elements, the deformation or detachment of interior finishes.

This is to limit the probability of the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, or
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics.

### **Intent(s)**

*Intent 1.* To limit the probability of installing interior finishes of inadequate strength or rigidity, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to--where interior finishes are required to protect foamed plastics--a loss of fire protection.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

### **Provision: 9.29.9.3.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for particleboard, OSB or waferboard as an interior finish, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support for particleboard, OSB or waferboard as an interior finish, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for particleboard, OSB or waferboard as an interior finish, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F20, F22-OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for particleboard, OSB or waferboard as an interior finish, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, and
- damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.29.9.3.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.3, OS2.4, OS2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for OSB and waferboard interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.4, OP2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for OSB and waferboard interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural collapse of wood-frame construction, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, and
- damage to the building.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for OSB and waferboard interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to walls that support floors.

[F22-OS3.7] Applies to walls that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for OSB and waferboard interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of:

- compromised structural integrity, or
- the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of floors, or
- the excessive movement or deformation of walls.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, and
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to walls that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate fastening for OSB and waferboard interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

For floors and constructions supporting floors, this is to limit the probability of:

- compromised structural integrity, or
- for exterior walls supporting a floor, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of excessive movement, vibration or deflection of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inadequate fastening for OSB and waferboard interior finishes in required braced wall panels, which could lead to an inability to resist expected lateral loads, which could lead to excessive racking.

This is to limit the probability of the displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Intent(s)**

*Intent 1.* To direct Code users to Sentence 9.23.3.5.(2)

*Intent 2.* To supersede the requirements of Sentence 9.29.9.3.(1), which would otherwise require 38 mm nails, if certain conditions are met.

### **Provision: 9.29.9.4.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2] Applies where interior finishes support or serve as required environmental separation elements.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

Where interior finishes support or serve as required environmental separation elements, this is to limit the probability of the deformation or detachment of interior finishes, which could lead to the failure of required environmental separation elements, which could lead to:

- condensation,
- precipitation ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies where interior finishes are required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes are required to protect foamed plastics, a loss of fire protection, or
- where interior finishes are installed to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F20, F22-OP2.4]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate rigidity of interior finishes, which could lead to an inability to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where interior finishes contribute to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where interior finishes support or provide the substrate for required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Provision: 9.29.10.1.(1)**

#### **Objective**

OH1

#### **Attributions**

[F20, F81-OH1.1, OH1.2] Applies where the substrate serves as a required environmental separation element.

### **Intent(s)**

*Intent 1.* To limit the probability of the dislodgement of tiles or the ingress of water behind tiles, which could lead to compromised protection for moisture-vulnerable substrates, which could lead to the deterioration of the substrate, which could lead to studs being unable to resist expected impact, gravity or lateral loads.

This is to limit the probability of:

- the generation of pollutants on surfaces or within assemblies from biological growth or from materials that become unstable on wetting, or
- where the substrate serves as a required environmental separation element, the failure of such elements, which could lead to:
  - condensation,
  - precipitation ingress,
  - pollutant ingress, or
  - compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the further generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.5] [F22-OS2.4, OS2.5] Applies where the substrate for the tile contributes to the required bracing or lateral support for studs.

[F20-OS2.3] Applies where the substrate for the tile serves as a required environmental separation element or where the tile is installed to provide the required waterproof wall finish.

**Intent(s)**

*Intent 1.* To limit the probability of the dislodgement of tiles or the ingress of water behind tiles, which could lead to compromised protection for moisture-vulnerable substrates, which could lead to the deterioration of the substrate, which could lead to studs being unable to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where the substrate for the tile contributes to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where the substrate for the tile serves as a required environmental separation element, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

- where the substrate for the tile contributes to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where the substrate for the tile serves as a required environmental separation element, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Provision: 9.29.10.2.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20-OS2.5] [F22-OS2.4, OS2.5] Applies where the substrate for the tile contributes to the required bracing or lateral support for studs.

[F20, F80-OS2.3] Applies where the substrate for the tile serves as a required environmental separation element or where the tile is installed to provide the required waterproof wall finish.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of cementitious material, which could lead to the dislodgement of tiles or the ingress of water behind tiles, which could lead to compromised protection for moisture-vulnerable substrates, which could lead to the deterioration of the substrate, which could lead to studs being unable to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where the substrate for the tile contributes to the required bracing or lateral support for studs, the buckling or racking of walls, which could lead to structural failure, or
- where the substrate for the tile serves as a required environmental separation element, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F20, F80-OS1.2] Applies where the substrate is required to act as fire protection for foamed plastics or to contribute to the required fire resistance of assemblies.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of cementitious material, which could lead to the dislodgement of tiles or the ingress of water behind tiles, which could lead to compromised protection for moisture-vulnerable substrates, which could lead to the deterioration of the substrate, which could lead to studs being unable to resist expected impact, gravity or lateral loads.

This is to limit the probability of the deformation or detachment of interior finishes, which could lead to:

- where the substrate is required to protect foamed plastics, a loss of fire protection, or
- where the substrate is required to contribute to the required fire resistance of assemblies, a loss of fire resistance.

This is to limit the probability of the growth and spread of fire, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F20, F80, F81-OH1.1, OH1.2] Applies where the substrate serves as a required environmental separation element.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength of cementitious material, which could lead to the dislodgement of tiles or the ingress of water behind tiles, which could lead to compromised protection for moisture-vulnerable substrates, which could lead to the deterioration of the substrate, which could lead to studs being unable to resist expected impact, gravity or lateral loads.

This is to limit the probability of:

- the generation of pollutants, on surfaces or within assemblies, from biological growth or from materials that become unstable on wetting, or
- where the substrate serves as a required environmental separation element, the failure of such elements, which could lead to:
  - condensation,
  - precipitation ingress,
  - pollutant ingress, or
  - compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces,
- the further generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

*Intent 1.* To limit the probability that the performance of caulking will fall significantly below expectations, which could lead to the premature failure of caulking, which could lead to the failure of tiles and substrates on repeated exposure to water, which could lead to the ingress of water into assemblies.

This is to limit the probability of the deterioration of the substrate, which could lead to:

- where the substrate contributes to the required bracing or lateral support for studs, structural failure, or

---

## **Intent Statements: NBC 2010**

- where the substrate supports required environmental separation elements, the excessive deformation, displacement or failure of such elements, which could lead to further deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

### **Provision: 9.30.1.1.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessively rough or uneven floor surfaces, which could lead to persons falling or being injured from contact with such surfaces, which could lead to harm to persons.

---

#### **Objective**

OH2

#### **Attributions**

[F40, F41-OH2.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of the accumulation of dirt, which could lead to the growth of bacteria, which could lead to harm to persons.

---

### **Provision: 9.30.1.2.(1)**

#### **Objective**

OS2

#### **Attributions**

[F80-OS2.3] Applies where finished flooring is required to provide water resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate protection of subfloors, which, on repeated exposure to water, could lead to compromised structural integrity of the supporting structure, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F41, F81-OH1.1] Applies where finished flooring is required to provide water resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate protection of subfloors, which, on repeated exposure to water, could lead to:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of the subfloor.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.30.1.3.(1)**

---

**Objective**

OS3

**Attributions**

[F20, F80-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of the failure of flooring under expected service loads, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F80-OH1.1] Applies to portion of Code text: "Wood sleepers supporting finished flooring over a concrete base supported on the ground ... shall be treated with a wood preservative."

**Intent(s)**

*Intent 1.* To limit the probability of inadequate decay resistance, which could lead to the decay of wood sleepers on repeated exposure to moisture, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.30.1.4.(1)**

---

**Intent(s)**

*Intent 1.* To define what is meant by finished flooring in Sentence 9.30.1.1.(1).

---

**Provision: 9.30.2.1.(1)**

---

**Objective**

OS3

**Attributions**

[F81-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of excessive irregularities on the surface of the substrate on which the finished flooring is installed, which could lead to the displacement or cracking of finished flooring.

This is to limit the probability of:

- rough or uneven finished floor surfaces, which could lead to persons tripping or falling, or

---

## **Intent Statements: NBC 2010**

- where finished flooring is required to provide water resistance, the ingress of water into the sub-floor, which could lead to compromised physical integrity of the supporting structure, which could lead to uneven finished floor surfaces, which could lead to persons tripping or falling.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F81-OS2.3] Applies where finished flooring is required to provide water resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive irregularities on the surface of the substrate on which the finished flooring is installed, which could lead to the displacement or cracking of finished flooring.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the subfloor, which could lead to compromised structural integrity of the supporting structure, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F81-OH1.1] Applies where finished flooring is required to provide water resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive irregularities on the surface of the substrate on which the finished flooring is installed, which could lead to the displacement or cracking of finished flooring.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the subfloor, which could lead to:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of the finished flooring and the subfloor.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

## **Provision: 9.30.2.1.(2)**

---

### **Objective**

OS3

### **Attributions**

[F81-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability of excessive surface irregularities at unsupported joints in subfloor panels, which could lead to the displacement or cracking of finished flooring.

This is to limit the probability of:

- rough or uneven finished floor surfaces, which could lead to persons tripping or falling, or
- where finished flooring is required to provide water resistance, the ingress of water into the sub-floor, which could lead to compromised physical integrity of the supporting structure, which could lead to uneven finished floor surfaces, which could lead to persons tripping or falling.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F81-OS2.3] Applies where finished flooring is required to provide water resistance.

**Intent(s)**

*Intent 1.* To limit the probability of excessive surface irregularities at unsupported joints in subfloor panels, which could lead to the displacement or cracking of finished flooring.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the subfloor, which could lead to compromised structural integrity of the supporting structure, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F81-OH1.1] Applies where finished flooring is required to provide water resistance.

**Intent(s)**

*Intent 1.* To limit the probability of excessive surface irregularities at unsupported joints in subfloor panels, which could lead to the displacement or cracking of finished flooring.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the subfloor, which could lead to:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of the finished flooring and the subfloor.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.30.2.1.(3)**

---

**Objective**

OS3

**Attributions**

[F81-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate bridging of subfloor joints, which could lead to differential movement between adjoining subfloor panels, which could lead to the displacement or cracking of ceramic tile.

This is to limit the probability of:

- rough or uneven finished floor surfaces, which could lead to persons tripping or falling, or
- where finished flooring is required to provide water resistance, the ingress of water into the subfloor, which could lead to compromised physical integrity of the supporting structure, which could lead to uneven finished floor surfaces, which could lead to persons tripping or falling.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F81-OH1.1] Applies where finished flooring is required to provide water resistance.

---

### **Provision: 9.30.3.2.(3)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate end support for wood strips, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

**Provision: 9.30.3.3.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate attachment of wood strips relative to their width, which could lead to warping or buckling from the movement of wood due to variations in moisture content, which could lead to uneven finished floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

**Provision: 9.30.3.3.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of nail heads protruding above the surface of finished flooring due to shrinkage of the wood, which could lead to persons cutting themselves, tripping or falling, which could lead to harm to persons.

**Provision: 9.30.3.4.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of warping or buckling of wood due to variations in moisture content, which could lead to the displacement or cracking of finished flooring, which could lead to rough or uneven finished floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

**Provision: 9.30.4.1.(1)**

---

**Objective**

OS3

**Attributions**

[F81-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of warping or buckling of wood due to variations in moisture content, which could lead to the displacement or cracking of finished flooring, which could lead to rough or uneven finished floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.30.5.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F41, F80-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance of finished flooring to alkali or moisture, which could lead to the accelerated deterioration of flooring.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the further deterioration of the flooring.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F80-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance of finished flooring to alkali or moisture, which could lead to the accelerated deterioration of flooring, which could lead to the displacement or cracking of finished flooring, which could lead to rough or uneven finished floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

### **Provision: 9.30.5.1.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F81, F80-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the delamination of flooring material from the slab on exposure to alkali from concrete, or to moisture, which could lead to the displacement or cracking of finished flooring, which could lead to rough or uneven finished floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F41-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the delamination of flooring material from the slab on exposure to alkali from concrete, or to moisture.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the accelerated deterioration of the adhesive or flooring.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.30.6.1.(1)**

---

**Objective**

OS3

**Attributions**

[F81-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for ceramic tile, which could lead to the displacement or cracking of finished flooring, which could lead to rough or uneven finished floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F81-OH1.1] Applies where finished flooring is required to provide water resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for ceramic tile, which could lead to the displacement or cracking of finished flooring.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the underlay or subfloor, which could lead to:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of the finished flooring.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F81-OS2.3] Applies where finished flooring is required to provide water resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for ceramic tile, which could lead to the cracking of finished flooring.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the underlay or subfloor, which could lead to the accelerated deterioration of the floor assembly, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.30.6.1.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1] Applies where finished flooring is required to provide water resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of differential movement between adjoining panels, which could lead to the cracking of ceramic tile.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the underlay and subfloor, which could lead to:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of the finished flooring and the subfloor.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F81-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of differential movement between adjoining panels, which could lead to the cracking of ceramic tile.

This is to limit the probability of:

- rough or uneven finished floor surfaces, which could lead to persons tripping or falling, or
- where finished flooring is required to provide water resistance, the ingress of water into the subfloor, which could lead to compromised physical integrity of the supporting structure, which could lead to uneven finished floor surfaces, which could lead to persons tripping or falling.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F81-OS2.3] Applies where finished flooring is required to provide water resistance.

#### **Intent(s)**

*Intent 1.* To limit the probability of differential movement between adjoining panels, which could lead to the cracking of ceramic tile.

Where finished flooring is required to provide water resistance, this is to limit the probability of the ingress of water into the subfloor, which could lead to compromised structural integrity of the supporting structure, which could lead to an inability to resist expected gravity loads, which could lead to structural collapse, which could lead to harm to persons.

### **Provision: 9.31.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.31.

**Provision:** 9.31.1.1.(2)

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 3.7.2. to plumbing facilities, grab bars, floor drains, and floor and wall finishes around urinals in Part 9 buildings other than facilities in dwelling units.

**Provision:** 9.31.1.1.(3)

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 3.7.3. to medical gas piping systems in Part 9 buildings.

**Provision:** 9.31.1.1.(4)

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.36., which contains requirements regarding the energy efficiency of systems used for service water heating including service water used to heat interior swimming pools in dwelling units

**Provision:** 9.31.2.1.(1)

---

**Intent(s)**

*Intent 1.* To direct Code users to Part 7, which contains requirements related to the construction, extension, alteration, renewal or repair of plumbing systems and sewage disposal systems.

**Provision:** 9.31.2.2.(1)

---

**Objective**

OH2

**Attributions**

[F80-OH2.1]

**Intent(s)**

*Intent 1.* To limit the probability that metal pipes will deteriorate at an excessive rate, which could lead to the premature failure of water supply and sewage pipes, which could lead to pollutant leakage, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that metal pipes will deteriorate at an excessive rate, which could lead to the premature failure of water supply and sewage pipes, which could lead to erosion of soil supporting

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of accumulation of water from frequent cleaning.

This is to limit the probability of:

- an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.31.5.1.(1)**

#### **Objective**

OH2

#### **Attributions**

[F72-OH2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate disposal of waste, which could lead to contact with sewage, which could lead to harm to persons.

---

### **Provision: 9.31.5.2.(1)**

#### **Objective**

OH2

#### **Attributions**

[F72-OH2.1]

#### **Intent(s)**

*Intent 1.* Where the cost of connection to a public sewage system is not prohibitive, to limit the probability of an inadequate removal of waste, which could lead to contact with sewage, which could lead to harm to persons.

---

### **Provision: 9.31.5.2.(2)**

#### **Objective**

OH2

#### **Attributions**

[F72-OH2.1]

#### **Intent(s)**

*Intent 1.* Where the cost of connection to a public sewage system is prohibitive, to limit the probability of an inadequate removal of waste, which could lead to contact with sewage, which could lead to harm to persons.

---

**Provision: 9.31.6.1.(1)**

**Objective**

OH2

**Attributions**

9.31.6.1.(1)(a) [F40-OH2.1, OH2.4] [F71-OH2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate supply of hot water, which could lead to:

- an inability to maintain personal hygiene, which could lead to the growth of harmful bacteria, and
- an inability to adequately clean up waste or remove contaminants from building surfaces or contents.

This is to limit the probability of an inadequate level of sanitation, which could lead to harm to persons.

---

**Attributions**

9.31.6.1.(1)(b)

**Intent(s)**

*Intent 1.* To direct Code users to Part 7, which identifies requirements for the installation of equipment to supply hot water.

---

**Provision: 9.31.6.2.(1)**

**Objective**

OS3

**Attributions**

[F31, F30, F81-OS3.2] [F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of service water heaters will fall significantly below expectations, which could lead to malfunctions such as:

- overheating of water,
- accidental discharge of hot water, or
- leakage of carbon monoxide gas into living spaces.

This is to limit the probability of harm to persons.

---

**Provision: 9.31.6.2.(2)**

**Objective**

OH1

**Attributions**

[F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the quality of installation of service water heaters will fall significantly below expectations, which could lead to the spillage of combustion products into living spaces, which could lead to negative effects on the air quality in indoor spaces, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the quality of installation of service water heaters will fall significantly below expectations, which could lead to spillage of combustion products, which could lead to fire, which could lead to harm to persons.

---

### **Provision: 9.31.6.2.(3)**

---

### **Objective**

OS3

### **Attributions**

[F23-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that the service water heaters will overturn, which would lead to broken electricity lines or ruptured fuel or water lines, which could lead to exposure to:

- hot water,
- electrical shock, or
- noxious gases.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the service water heaters will overturn, which would lead to broken electricity lines or ruptured fuel or water lines, which could lead to fire, which could lead to harm to persons.

---

### **Provision: 9.31.6.3.(1)**

---

### **Objective**

OH2

### **Attributions**

[F81, F80-OH2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the premature failure of storage tanks for service water heaters, which could lead to a loss of hot water supply, which could lead to an inability to maintain a basic level of sanitation, which could lead to harm to persons.

**Provision: 9.31.6.4.(1)**

---

**Objective**

OH1

**Attributions**

[F41-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate venting, which could lead to the ingress of combustion products into living spaces, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate venting, which could lead to excessive radiant heat loss, which could lead to failure at joints or to burn-through, which could lead to the ignition of combustible building components, which could lead to harm to persons.

**Provision: 9.31.6.5.(1)**

---

**Objective**

OS3

**Attributions**

[F31-OS3.2]

**Intent(s)**

*Intent 1.* To limit the probability of excessively high water temperature, which could lead to excessive pressures in pipe systems, which could lead to failure of joints, heating coils or storage tanks, which could lead to exposure to hot water, which could lead to harm to persons.

*Intent 2.* To limit the probability that the water temperature will exceed the maximum temperature permitted by Sentence 9.31.6.1.(1), which could lead to scalding temperatures at faucets, which could lead to harm to persons.

---

**Objective**

OH2

**Attributions**

[F71-OH2.3]

**Intent(s)**

*Intent 1.* To limit the probability of a loss of hot water supply, which could lead to an inability to maintain a basic level of sanitation, which could lead to harm to persons.

**Provision: 9.32.1.1.(1)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To state the application of Section 9.32.

### **Provision: 9.32.1.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Part 6 to non-residential occupancies in Part 9 buildings.

### **Provision: 9.32.1.1.(3)**

---

#### **Intent(s)**

*Intent 1.* To define as residential, for the purposes of Section 9.32., smaller storage garages serving residential occupancies, on the basis that they are sufficiently small so as not to present high contaminant loads.

*Intent 2.* To limit the application of Part 6, as described in Sentence 9.32.1.1.(2), with respect to storage garages considered part of a residential occupancy.

### **Provision: 9.32.1.1.(4)**

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.36., which contains requirements regarding the energy efficiency of systems used for heating, ventilating and where installed, air-conditioning

### **Provision: 9.32.1.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Intent(s)**

*Intent 1.* [Clause (a)] To state the application of Subsection 9.32.2., which contains requirements for non-heating-season ventilation for residential occupancies.

*Intent 2.* [Clause (b)] To direct Code users to Part 6 [in particular Subsection 6.2.2.] for provisions regarding the heating-season ventilation of residential occupancies that contain heating systems and are supplied with electrical power.

---

**Provision: 9.32.1.2.(2)**

**Objective**

OH1

**Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.32.3.

*Intent 2.* To exempt self-contained heating-season ventilation systems serving single dwelling units supplied with a heating system and electrical power from the application of Part 6.

---

**Provision: 9.32.1.2.(3)**

**Intent(s)**

*Intent 1.* To exempt exits and public corridors in houses containing a secondary suite from the requirements of Sentence 9.32.1.2.(1), which would otherwise require a heating-season ventilation system.

*Intent 2.* To exempt ancillary spaces not within a dwelling unit in houses containing a secondary suite from the requirements of Sentence 9.32.1.2.(1), which would otherwise require a heating season ventilation system.

---

**Provision: 9.32.1.2.(4)**

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To expand the application of Article 9.32.3.8. to include ancillary spaces that have an exhaust device and where these ancillary spaces are not within dwelling units in houses with secondary suites.

### **Provision: 9.32.2.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To state the application of Articles 9.32.2.2. and 9.32.2.3.

### **Provision: 9.32.2.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F52-OH1.2] [F40, F52, F50-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Provision: 9.32.2.2.(2)**

---

**Intent(s)**

*Intent 1.* To clarify how natural ventilation requirements for living rooms and dining rooms may be satisfied by openable areas connecting vestibules that open directly off these rooms with the outdoors.

**Provision: 9.32.2.2.(3)**

---

**Objective**

OH2

**Attributions**

[F42-OH2.5]

**Intent(s)**

*Intent 1.* To limit the probability of an infestation of insects or vermin, which could lead to unsanitary conditions, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F61, F42-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation ingress, or
- an infestation of insects or vermin.

This is to limit the probability of the generation of pollutants from biological growth or from materials that become unstable on wetting, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F61, F42-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation ingress, or
- an infestation of termites or carpenter ants.

This is to limit the probability of the accelerated deterioration of wood structural elements, which could lead to structural collapse, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.2.2.(4)**

---

#### **Objective**

OH2

#### **Attributions**

[F80-OH2.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of the premature failure of screening, which could lead to the entry of insects or vermin, which could lead to unsanitary conditions, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F80, F42-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of the premature failure of screening, which could lead to the blockage of natural ventilation openings, which could lead to inadequate ventilation.

This is to limit the probability of the inadequate control of:

- airborne pollutants, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Provision: 9.32.2.3.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate ventilation, which could lead to the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

### **Provision: 9.32.2.3.(2)**

---

#### **Intent(s)**

*Intent 1.* To clarify the application of Table 9.32.2.3.

---

**Provision: 9.32.2.3.(3)**

**Objective**

OH1

**Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F40, F50, F53-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate replacement of indoor air with outdoor air, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of the entry of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of heating-season mechanical ventilation systems will fall significantly below expectations.

This is to limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* [Clause (a)] To direct Code users to good practice options, such as those contained in CAN/CSA-F326-M, for the design of heating-season mechanical ventilation systems.

*Intent 3.* [Clause (b)] To state the application of Subsection 9.32.3., which contains requirements for heating-season mechanical ventilation systems in dwelling units with 5 or fewer bedrooms.

### **Provision: 9.32.3.1.(2)**

---

#### **Objective**

OH1

#### **Attributions**

9.32.3.1.(2)(a), 9.32.3.1.(2)(b) [F40, F50, F52-OH1.1]

9.32.3.1.(2)(a), 9.32.3.1.(2)(b) [F51, F52-OH1.2]

9.32.3.1.(2)(c) [F53-OH1.1]

**Intent(s)**

*Intent 1.* [Clauses (a) and (b)] To limit the probability that the performance of heating-season mechanical ventilation systems will fall significantly below expectations.

This is to limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* [Clause (c)] To limit the probability of excessive negative pressure, which could lead to:

- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 3.* To direct Code users to Articles 9.32.3.3., 9.32.3.7. and 9.32.3.8., for requirements regarding required components of heating-season mechanical ventilation systems in dwelling units with 5 or fewer bedrooms.

---

**Objective**

OS3

**Attributions**

9.32.3.1.(2)(c) [F53-OS3.4]

**Intent(s)**

*Intent 1.* [Clause (c)] To limit the probability of the inadequate replacement of indoor air with outdoor air, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of the entry of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To direct Code users to Article 9.32.3.8. for requirements regarding protection against depressurization in heating-season mechanical ventilation systems in dwelling units with 5 or fewer bedrooms.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.2.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F52-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of mechanical ventilation systems will fall significantly below expectations, which could lead to the inadequate control of relative humidity, which could lead to condensation, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F40, F52, F50-OH1.1] [F52, F51-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of heating-season mechanical ventilation systems will fall significantly below expectations.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Provision: 9.32.3.2.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of mechanical ventilation systems will fall significantly below expectations or that they will fail prematurely.

This is to limit the probability of:

- the inadequate control of airborne pollutants, or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- excessive negative pressure, which could lead to:
  - the ingress of soil gases (such as methane and radon),

- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground, or
- excessive positive pressure, which could lead to condensation within assemblies.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.32.3.2.(3)****Objective**

OH1

**Attributions**

[F81-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the transmission of excessive noise or vibration, which could lead to occupants not using the fans or disabling them, which could lead to inadequate ventilation, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt fans and heat recovery ventilators fixed only to a concrete base from the requirement to install resilient mountings, on the basis that concrete is unlikely to transmit vibration generated by the equipment to occupied space.

---

**Objective**

OS3

**Attributions**

[F81-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of the transmission of excessive noise or vibration, which could lead to occupants disabling the supply fans, which could lead to excessive negative pressure (where supply fans alone are disabled), which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To exempt fans and heat recovery ventilators fixed only to a concrete base from the requirement to install resilient mountings, on the basis that concrete is unlikely to transmit vibration generated by the equipment to occupied space.

---

**Provision: 9.32.3.2.(4)****Objective**

OH1

**Attributions**

[F40, F43, F50, F53-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the dislodgement of flow-regulating dampers will go unnoticed and unrectified, which could lead to an inability to regulate the airflow in ventilation systems, which could lead to:

- when the damper is closed, inadequate ventilation or excessive negative pressure, and

---

## **Intent Statements: NBC 2010**

- when the damper is fully open in cold weather, thermal shock to heat exchangers.

This is to limit the probability of:

- the inadequate control of airborne pollutants, or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- where there is excessive negative pressure:
  - the ingress of soil gases (such as methane and radon),
  - the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
  - moisture ingress from the ground, or
- cracking or premature failure of heat exchangers, which could lead to the leakage of combustion gases into living space.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

[F43, F53, F82-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that flow-regulating dampers will create too small an opening, which could lead to excessive negative pressure (where supply fans alone are affected), which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To limit the probability that flow-regulating dampers will create too large an opening during cold weather, which could lead to thermal shock to heat exchangers, which could lead to the premature failure or cracking of heat exchangers, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

## **Provision: 9.32.3.2.(5)**

---

### **Objective**

OH1

### **Attributions**

[F82-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of the system will become compromised, which could lead to inadequate ventilation.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.32.3.2.(6)**

---

**Objective**

OH1

**Attributions**

[F63, F81-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that components will corrode or that condensate will freeze, which could lead to the premature failure of motors and fans, which could lead to inadequate ventilation, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.32.3.3.(1)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of heating-season mechanical ventilation systems will fall significantly below expectations.

This is to limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* [Clause (b)] To direct Code users:

- for dwelling units with forced air heating systems, to provisions regarding the introduction of outdoor air stated in Article 9.32.3.4.,
- for dwelling units without forced air heating systems, to provisions regarding the introduction of outdoor air stated in Article 9.32.3.5., or
- for dwelling units meeting certain conditions such that depressurization does not present a hazard to occupants, to Article 9.32.3.6., which permits exhaust-only ventilation systems.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.3.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1] [F51, F52-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Provision: 9.32.3.3.(3)**

---

#### **Intent(s)**

*Intent 1.* To clarify that the requirement for a principal ventilation fan may be satisfied by

- a single fan,
- the exhaust side of a heat recovery ventilator, or
- multiple ganged fans.

### **Provision: 9.32.3.3.(4)**

---

#### **Objective**

OH1

#### **Attributions**

[F80, F81-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that equipment will fail prematurely, which could lead to an inability to regulate the airflow in ventilation systems, which could lead to:

- where both exhaust and supply fans are affected, inadequate ventilation,
- where exhaust fans alone are affected, excessive positive pressure, or
- where supply fans alone are affected, excessive negative pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants, or oxygen and other components necessary for breathable air,

---

## Intent Statements: NBC 2010

- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- excessive negative pressure, which could lead to:
  - the ingress of soil gases (such as methane and radon),
  - the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
  - moisture ingress from the ground, or
- excessive positive pressure, which could lead to condensation within assemblies.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### Provision: 9.32.3.3.(5)

#### Objective

OH1

#### Attributions

[F81-OH1.1]

#### Intent(s)

*Intent 1.* To limit the probability of:

- occupants being unable to control the principal ventilation fan, and
- occupants having difficulty finding the principal ventilation fan control or understanding the control's function.

This is to limit the probability that occupants:

- will disconnect the fans, or
- will be unaware of their ability to control ventilation fans, which could lead to fans not being used.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### Provision: 9.32.3.3.(6)

#### Objective

OH1

#### Attributions

[F81-OH1.1]

#### Intent(s)

*Intent 1.* To limit the probability that occupants will not be able to turn off the principal ventilation system, which could lead to their disconnecting the system, which could lead to a lack of ventilation when required.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- inadequate ventilation, or
- the inadequate control of relative humidity.

This is to limit the probability of the inadequate control of:

- indoor air temperatures,
- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.4.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F50, F51, F81-OH1.1] [F51, F81-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the flow of outdoor air through the furnace, which is needed to balance the actual normal operating exhaust capacity of the principal ventilation fan, will exceed the amount that can be tempered by the available return airflow to a temperature that is safe for the furnace heat exchanger.

This is to limit the probability of:

- thermal shock to heat exchangers, or
- the condensation of combustion gases or water vapour.

This is to limit the probability of cracking or premature failure of heat exchangers, which could lead to:

- the leakage of combustion gases into living space, or
- an inoperative furnace.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* [Clause (b)] Where the normal operating exhaust capacity of the principal ventilation fan exceeds the maximum permitted outdoor airflow, and the system does not incorporate means for tempering outdoor air, to direct Code users to Clause 9.32.3.1.(1)(a) or Article 9.32.3.5.

---

#### **Objective**

OS3

#### **Attributions**

[F43, F50, F81-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of the occasional excessive flow of cold outdoor air through the furnace under wind pressure.

This is to limit the probability of:

- thermal shock to heat exchangers, or
- condensation of combustion gases or water vapour.

This is to limit the probability of cracking, corrosion, or premature failure of the heating appliance, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* [Clause (b)] Where the normal operating exhaust capacity of the principal ventilation fan exceeds the maximum permitted outdoor airflow, and the system does not incorporate means for tempering outdoor air, to direct Code users to Clause 9.32.3.1.(1)(a) or Article 9.32.3.5.

---

### **Provision: 9.32.3.4.(3)**

---

#### **Intent(s)**

*Intent 1.* To clarify how to determine the furnace airflow for use with Table 9.32.3.4.

---

**Provision: 9.32.3.4.(4)**

---

**Intent(s)**

*Intent 1.* To clarify one of Code users' options in using Table 9.32.3.4.

---

**Provision: 9.32.3.4.(5)**

---

**Objective**

OH1

**Attributions**

[F40, F43, F50, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that outdoor air will not be introduced into the heating system's ducts, which could lead to an inadequate distribution of outdoor air throughout the dwelling unit.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To limit the probability that outdoor air will only be able to enter the dwelling unit through the building envelope, which could lead to depressurization, which could lead to the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 3.* To limit the probability that, on occasion, excessively cold outdoor air will not be adequately mixed with the heating system's return air before it reaches the furnace heat exchanger, which could lead to:

- thermal shock to the heat exchanger, or
- the condensation of combustion gases or water vapour on the heat exchanger.

This is to limit the probability of cracking or premature failure of the heating appliance, which could lead to the leakage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

9.32.3.4.(5)(a) [F43, F50, F53-OS3.4]

9.32.3.4.(5)(b) [F43, F50, F81-OS3.4]

**Intent(s)**

*Intent 1.* [Clause (a)] To limit the probability of the inadequate replacement of indoor air with outdoor air, which could lead to the excessive depressurization of dwelling units by exhaust fans, which could lead to the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of the entry of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* [Clauses (a) and (b)] To limit the probability of the inadequate mixing of indoor air with return air, which could lead to untempered outdoor air passing over the furnace heat exchanger, which could lead to:

- thermal shock to the heat exchanger, or
- the condensation of combustion gases or water vapour.

This is to limit the probability of cracking or premature failure of the heat exchanger, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.4.(6)**

#### **Objective**

OH1

#### **Attributions**

[F53-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inability to regulate the flow of outdoor air in ventilation systems, which could lead to:

- an outdoor air supply flow that is less than the normal operating exhaust capacity of the principal ventilation fan, which could lead to inadequate ventilation or excessive negative pressure, or
- an outdoor air supply flow that is greater than the normal operating exhaust capacity of the principal ventilation fan, which could lead to excessive positive pressure.

This is to limit the probability of:

- where there is excessive negative pressure:
  - the ingress of soil gases (such as methane and radon),
  - the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
  - moisture ingress from the ground, or
- where there is excessive positive pressure, condensation within assemblies.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F43, F50, F53-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inability to regulate the supply of outdoor air to the dwelling unit, which could lead to excessive negative pressure (where supply fans alone are affected), which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To limit the probability of an inability to regulate the supply of outdoor air to the dwelling unit during cold weather, which could lead to thermal shock to the heat exchanger, which could lead to premature failure or cracking of the heat exchanger, which could lead to the leakage of carbon monoxide gas into living spaces, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OS2

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* [Clauses (a) and (b)] To limit the probability of the premature failure of outdoor air supply fans, which could lead to the inadequate replacement of indoor air with outdoor air.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Clause (c)] To limit the probability that the outdoor air supply flow will not be equal to the normal operating exhaust capacity of the principal ventilation fan, which could lead to:

- excessive negative pressure, or
- excessive positive pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants, or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- where there is excessive negative pressure:
  - the ingress of soil gases (such as methane and radon),
  - the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
  - moisture ingress from the ground, or
- where there is excessive positive pressure, condensation within assemblies.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F40, F43, F50, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the outdoor air supply flow will not be equal to the normal operating exhaust capacity of the principal ventilation fan, which could lead to excessive depressurization, which could lead to:

- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- the inadequate replacement of indoor air with outdoor air.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air,
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the entry of combustion products into living space.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F43, F50, F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that the outdoor air supply flow will not be equal to the normal operating exhaust capacity of the principal ventilation fan, which could lead to excessive depressurization of dwelling units by exhaust fans, which could lead to the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of the entry of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.5.(5)**

---

#### **Objective**

OH1

#### **Attributions**

[F53-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inability to regulate the flow of outdoor air in ventilation systems, which could lead to:

- an outdoor air supply flow that is less than the normal operating exhaust capacity of the principal ventilation fan, which could lead to inadequate ventilation or excessive negative pressure, or
- an outdoor air supply flow that is greater than the normal operating exhaust capacity of the principal ventilation fan, which could lead to excessive positive pressure.

This is to limit the probability of:

- where there is excessive negative pressure:
  - the ingress of soil gases (such as methane and radon),
  - the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
  - moisture ingress from the ground, or
- where there is excessive positive pressure, condensation within assemblies.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F53, F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the outdoor air supply flow will exceed the normal operating exhaust capacity of the principal ventilation fan, which could lead to excessive positive pressure within the dwelling unit, which could lead to condensation within the building envelope, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

---

#### **Objective**

OS3

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.5.(7)**

---

#### **Objective**

OH1

#### **Attributions**

[F53-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the required airflow measurements will not be within acceptable limits, which could lead to excessive negative or positive pressure within the dwelling unit, which could lead to harm to persons.

### **Provision: 9.32.3.5.(8)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F54-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that incoming cold outdoor air distributed by the ductwork will lead to drafts, which could lead to the inadequate thermal comfort of persons, which could lead to harm to persons.

### **Provision: 9.32.3.5.(9)**

---

#### **Objective**

OH1

#### **Attributions**

[F54-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that tempering devices will not function properly, which could lead to incoming cold outdoor air being distributed by the ductwork, which could lead to drafts, which could lead to the inadequate thermal comfort of persons, which could lead to harm to persons.

*Intent 2.* To expand the application of Articles 9.33.4.1. and 9.33.5.2. to the installation of duct heaters, heating coils, or other air-tempering devices for mechanical ventilation systems within the scope of Section 9.32.

### **Provision: 9.32.3.5.(10)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the localized accumulation of pollutants and humidity and a lack of fresh air.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt dwelling units in which every storey has a bedroom from the requirement in Clause 9.32.3.5.(10)(c) to supply outdoor air to the principal living area, in situations where the living area receives an adequate supply of outdoor air from other rooms in that storey [see Sentence 9.32.3.5.(11)].

---

**Provision: 9.32.3.5.(11)**

---

**Intent(s)**

*Intent 1.* To exempt dwelling units in which every storey has a bedroom from the requirement in Clause 9.32.3.5.(10)(c) to supply outdoor air to the principal living area, on the basis that the principal living area receives an adequate supply of outdoor air from other rooms supplied with outdoor air in that storey.

---

**Provision: 9.32.3.5.(12)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to balance outdoor airflow throughout rooms and spaces, which could lead to an inadequate supply of outdoor air to some rooms or spaces.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Clause (b)] To limit the probability that balance dampers will become dislodged without being noticed, which could lead to an inadequate supply of outdoor air to some rooms and spaces, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.32.3.5.(13)**

---

**Objective**

OH1

**Attributions**

[F51, F54-OH1.2]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of outdoor air moving across a room or space at floor level and being perceived as a draft, which could lead to the inadequate control of indoor air temperatures and drafts, which could lead to the inadequate thermal comfort of persons, which could lead to harm to persons.

---

### **Provision: 9.32.3.5.(14)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of fresh air to rooms or spaces not provided with a ducted outdoor air supply.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.32.3.6.(1)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate replacement of indoor air with outdoor air.

This is to limit the probability of the inadequate control of :

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Subclause (b)(i)] To expand the application of Articles 9.33.6.12. and 9.33.6.13. to exhaust-only ventilation systems.

---

#### **Objective**

OS3

#### **Attributions**

[F43-OS3.4]

### **Intent(s)**

*Intent 1.* In depressurization situations where air exhausting devices operate without adequate replacement of indoor air with outdoor air, to limit the probability of the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* [Subclause (b)(i)] To expand the application of Articles 9.33.6.12. and 9.33.6.13. to exhaust-only ventilation systems.

---

**Provision: 9.32.3.6.(2)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the operation of principal ventilation fans when circulation fans are not operating, which could lead to the inadequate distribution of outdoor air.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.32.3.6.(3)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate distribution of outdoor air.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt the principal ventilation fan from being interlocked with the circulation fans to comply with Sentence 9.32.3.6.(2), in circumstances where the forced air distribution system is equipped with controls that automatically activate the circulation fan at selected intervals, on the basis that the circulation fan will be activated to distribute outdoor air within the dwelling unit whether or not the principal ventilation fan is operating.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.7.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate removal of vapours and pollutants produced by cooking.

This is to limit the probability of the inadequate control of:

- airborne pollutants and vapours, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

### **Provision: 9.32.3.7.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain installations from the requirement to install a supplemental exhaust fan in the kitchen as stated in Sentence 9.32.3.7.(1), on the basis that the principal ventilation fan's single exhaust air intake, which is located in the kitchen, is likely to extract sufficient air from the kitchen to adequately remove vapours and pollutants produced by cooking.

### **Provision: 9.32.3.7.(3)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate removal of vapours and pollutants produced by cooking.

This is to limit the probability of the inadequate control of:

- airborne pollutants and vapours, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt certain installations from the requirement to install a supplemental exhaust fan in the kitchen as stated in Sentence 9.32.3.7.(1), on the basis that the significantly higher exhaust rate of the principal ventilation fan is likely to adequately remove vapours and pollutants produced by cooking.

**Provision: 9.32.3.7.(4)**

---

**Objective**

OH1

**Attributions**

[F40, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate removal of vapours and pollutants present in bathrooms and water-closet rooms.

This is to limit the probability of the inadequate control of:

- airborne pollutants, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt bathrooms and water-closet rooms with an exhaust air intake from the requirement to install a supplemental exhaust fan, on the basis that the principal ventilation fan will extract humidity and airborne pollutants through its exhaust air intake.

**Provision: 9.32.3.7.(5)**

---

**Objective**

OH1

**Attributions**

[F40, F52-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that vapours and pollutants produced by cooking will not be captured.

This is to limit the probability of the inadequate control of:

- airborne pollutants and vapours, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt cooking appliance exhaust fans serving cooktops in kitchens from the requirement to locate the fan intake on or near the ceiling, on the basis that the exhaust fan intakes capture cooking vapours and pollutants before they can disperse and rise towards the ceiling.

**Provision: 9.32.3.7.(6)**

---

**Objective**

OH1

**Attributions**

[F81-OH1.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that persons will be unable to manually control the supplemental exhaust fan, which could lead to exhaust fans not being used.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.32.3.7.(7)**

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants will:

- be unable to control the principal ventilation fan when supplemental exhaust is required in bathrooms and kitchens, or
- have difficulty finding the principal ventilation fan control or understanding the control's function.

This is to limit the probability of occupants being unaware of their ability to control ventilation fans, which could lead to fans not being used.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.32.3.7.(8)**

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants will be unable to exhaust contaminants not detected by an automatic control.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or

- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.32.3.8.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Article 9.32.3.8.

---

**Provision: 9.32.3.8.(2)**

---

**Objective**

OH1

**Attributions**

[F53-OH1.1]

**Intent(s)**

*Intent 1.* [Clause (a)] To limit the probability of excessive negative pressure, which could lead to:

- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Clause (b)] To limit the probability of an excessive volume of makeup air, which could lead to excessive positive pressure, which could lead to condensation within assemblies.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

9.32.3.8.(2)(a) [F43, F50, F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of excessive negative pressure in dwelling units, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OS2

**Attributions**

9.32.3.8.(2)(b) [F53, F63-OS2.3]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that the outdoor makeup air supply flow will exceed the exhaust capacity of the mechanical air exhausting device, which could lead to excessive positive pressure within dwelling units, which could lead to condensation within the building envelope, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

---

### **Provision: 9.32.3.8.(3)**

#### **Objective**

OH1

#### **Attributions**

[F53, F81-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the operation of exhaust fans without the simultaneous operation of related makeup air fans, which could lead to excessive depressurization, which could lead to:

- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F43, F50, F53, F81-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of the operation of exhaust fans without the simultaneous operation of related makeup air fans, which could lead to excessive depressurization, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.8.(4)**

#### **Objective**

OS3

#### **Attributions**

[F81-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants will disable outdoor air supply fans, which could lead to excessive negative pressure, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To exempt mechanical air exhausting devices that are principal ventilation fans operating at a rate not greater than the maximum permitted in Table 9.32.3.3. from the provisions in Article 9.32.3.8. for

outdoor make-up air fans, on the basis that Articles 9.32.3.4. and 9.32.3.5. address outdoor make-up air for the principal ventilation fan.

---

**Objective**

OH1

**Attributions**

[F81-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that occupants will disable outdoor air supply fans, which could lead to excessive negative pressure.

This is to limit the probability of:

- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Clause (b)] To limit the probability that outdoor makeup air will be perceived as a draft, which could lead to occupants disabling makeup air fans, which could lead to depressurization, which could lead to negative effects on indoor air quality, which could lead to harm to persons.

*Intent 3.* To exempt mechanical air exhausting devices that are principal ventilation fans operating at a rate not greater than the maximum permitted in Table 9.32.3.3. from the provisions in Article 9.32.3.8. for outdoor makeup air fans, on the basis that Articles 9.32.3.4. and 9.32.3.5. address outdoor makeup air for the principal ventilation fan.

---

**Provision: 9.32.3.8.(5)**

---

**Objective**

OH1

**Attributions**

[F53-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of supply fans, which could lead to excessive negative pressure.

This is to limit the probability of:

- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt supply fans from the requirement to be approved to handle untempered outdoor air, in situations where the outdoor makeup air is tempered before it reaches the supply fan.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F81-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the premature failure of supply fans, which could lead to overheating, which could lead to the ignition of combustible materials, which could lead to harm to persons.

*Intent 2.* To exempt supply fans from the requirement to be approved to handle untempered outdoor air, in situations where the outdoor makeup air is tempered before it reaches the supply fan.

---

### **Objective**

OS3

### **Attributions**

[F80, F81-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability of the premature failure of supply fans, which could lead to excessive negative pressure, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To exempt supply fans from the requirement to be approved to handle untempered outdoor air, in situations where the outdoor makeup air is tempered before it reaches the supply fan.

---

## **Provision: 9.32.3.8.(6)**

---

### **Intent(s)**

*Intent 1.* To exempt certain dwelling units with solid-fuel-burning appliances from the the requirement to provide makeup air [see Sentences 9.32.3.8.(1) to 9.32.3.8.(5)], in situations where the spillage of combustion products from solid-fuel-burning appliances is the sole likely adverse affect of depressurization and will be detected by the carbon monoxide alarming devices required by Sentence 9.32.3.9.(3) and Article 9.32.3.9.

---

## **Provision: 9.32.3.8.(7)**

---

### **Objective**

OS3

### **Attributions**

[F43, F50, F53-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that air-exhausting devices required by Sentence 9.32.3.8.(2) will operate without adequate replacement with outdoor air, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To exempt certain dwelling units from the requirement to provide makeup air [see Sentences 9.32.3.8.(1) to 9.32.3.8.(5)], where it can be shown using test procedures described in CAN/CGSB-51.71 that maximum depressurization levels will not likely cause the spillage of combustion products from fuel-fired appliances.

---

**Objective**

OH1

**Attributions**

[F53-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of excessive negative pressure, which could lead to:

- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt certain dwelling units from the requirement to provide makeup air [see Sentences 9.32.3.8.(1) to 9.32.3.8.(5)], where it can be shown using test procedures described in CAN/CGSB-51.71 that maximum depressurization levels will not likely cause the spillage of combustion products from fuel-fired appliances.

---

**Provision: 9.32.3.8.(8)**

---

**Intent(s)**

*Intent 1.* To exempt certain dwelling units from the requirements of Sentence 9.32.3.8.(2), where the mechanical exhausting device operates a subfloor depressurization system installed for the purpose of reducing the risk of radon ingress, on the basis that the risk of depressurizing a house by running a subfloor depressurization system is considerably small especially when considering that this system is used to mitigate another risk.

---

**Provision: 9.32.3.9.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Article 9.32.3.9.

---

**Provision: 9.32.3.9.(2)**

---

**Objective**

OS3

**Attributions**

9.32.3.9.(2)(a), 9.32.3.9.(2)(b), 9.32.3.9.(2)(d) [F44-OS3.4]

9.32.3.9.(2)(c) [F81-OS3.4]

**Intent(s)**

*Intent 1.* [Clauses (a), (b), (d)] To limit the probability that the performance of carbon monoxide alarming devices will fall significantly below expectations, which could lead to carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* [Clause (c)] To limit the probability that electrical connections and circuits for carbon monoxide alarming devices will be disconnected, which could lead to carbon monoxide alarming devices becoming non-operational, which could lead to carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.9.(3)**

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that carbon monoxide gas entering a living space from a solid-fuel-burning appliance will go undetected, which could lead to the acute poisoning or asphyxiation of persons, which could lead to harm to persons.

---

### **Provision: 9.32.3.9.(4)**

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To limit the probability that the carbon monoxide alarming devices will not be loud enough to wake sleeping occupants, which could lead to carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.9.(5)**

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* [Clause (a)] To limit the probability that the carbon monoxide alarming devices will not be loud enough to wake sleeping occupants, which could lead to carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 3.* [Clause (b)] To limit the probability that carbon monoxide gas will not be detected at or near its source, which could lead to carbon monoxide gas entering living space undetected or with less than the maximum possible warning time for occupants, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.32.3.9.(6)**

---

**Objective**

OS3

**Attributions**

[F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To limit the probability that carbon monoxide alarming devices will not be loud enough to wake sleeping occupants, which could lead to carbon monoxide gas entering living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.32.3.9.(7)**

---

**Objective**

OS3

**Attributions**

[F11-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that persons in any part of a house with a secondary suite will not be promptly notified of the presence of carbon monoxide in the air by the carbon monoxide alarming devices in another part of the house, which could lead to carbon monoxide gas entering a living space undetected, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.32.3.10.(1)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52, F53-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of excessive or insufficient airflow.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity,
- excessive negative pressure, or
- excessive positive pressure.

This is to limit the probability of:

- condensation within assemblies, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon),

---

## **Intent Statements: NBC 2010**

- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- drafts.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F53, F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the outdoor air supply flow will exceed the exhaust capacity of the mechanical air exhausting devices, which could lead to excessive positive pressure within the dwelling unit, which could lead to condensation within the building envelope, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

---

### **Provision: 9.32.3.10.(2)**

---

### **Objective**

OH1

### **Attributions**

[F81-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of excessively noisy fans, which could lead to occupants turning off or underutilizing the equipment necessary for ventilation, which could lead to the inadequate control of:

- airborne pollutants,
- relative humidity, or
- oxygen and other components necessary for breathable air.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Provision: 9.32.3.10.(3)**

---

### **Objective**

OH1

### **Attributions**

[F53-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the airflow resistance of ducts will not be taken into account, which could lead to inadequate ventilation where fans perform significantly below the required capacity.

This is to limit the probability of:

- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- the inadequate control of relative humidity.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that the airflow resistance of ducts will not be taken into account, which could lead to fans performing significantly below the required capacity, which could lead to an inadequate volume of makeup air, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.32.3.10.(4)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52, F53-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of heat recovery ventilators will fall significantly below expectations, which could lead to inadequate ventilation.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity and indoor air temperatures.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.10.(5)**

---

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of heat recovery ventilators will fall significantly below expectations in cold weather, which could lead to inadequate ventilation.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity and indoor air temperatures.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

### **Provision: 9.32.3.10.(6)**

---

#### **Objective**

OS3

#### **Attributions**

[F81-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that excessively noisy fans will lead to occupants disabling or not using fans, which could lead to excessive negative pressure (where supply fans alone are disabled), which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To exempt fans with less than 1 m of duct between themselves and unfinished basements, furnace rooms, utility rooms or attics from the sound ratings specified in Table 9.32.3.10.-B, on the basis that people do not normally occupy such areas for lengthy periods and would therefore be unlikely to be disturbed by noisy fans.

---

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that excessively noisy fans will lead to occupants disabling or not using fans, which could lead to inadequate ventilation, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt fans with less than 1 m of duct between themselves and unfinished basements, furnace rooms, utility rooms or attics from the sound ratings specified in Table 9.32.3.10.-B, on the basis that

people do not normally occupy such areas for lengthy periods and would therefore be unlikely to be disturbed by noisy fans.

**Provision: 9.32.3.10.(7)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52, F53-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of excessive or insufficient airflow.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- excessive negative pressure, or
- excessive positive pressure.

This is to limit the probability of:

- condensation within assemblies, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F81-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of ventilation devices will fall significantly below expectations, with respect to their causing electrical shock, injury or a fire, which could lead to harm to persons.

**Provision: 9.32.3.11.(1)**

---

**Objective**

OH1

**Attributions**

[F81-OH1.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that ducts will leak, which could lead to failure to completely remove pollutants or water vapour from buildings, which could lead to:

- the discharge of pollutants into living space or into spaces that communicate with living spaces, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To expand the application of Section 9.33. to include ventilation ducts and their fittings installed in dwelling units.

*Intent 3.* To exempt certain exhaust ducts from the requirement to be made of noncombustible material as stated in Article 9.33.6.2., on the basis that the ducts are unlikely to contain grease or other ignitable pollutants.

*Intent 4.* To direct Code users to Sentence 9.32.3.11.(6) for requirements regarding ductwork for range hoods and range-top fans.

---

### **Provision: 9.32.3.11.(2)**

#### **Objective**

OH1

#### **Attributions**

[F40, F52, F63-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of failure to completely remove pollutants or water vapour from buildings, which could lead to:

- the discharge of pollutants into living space or into spaces that communicate with living spaces, or
- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F52, F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of failure to completely remove water vapour from buildings, which could lead to condensation, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

**Provision: 9.32.3.11.(3)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that water vapour will condense on the interior surface of exhaust ducts, which could lead to:

- the deterioration of ducts, which could lead to the blockage of ducts (e.g. ducts collapsing due to corrosion), which could lead to inadequate ventilation, or
- the generation of pollutants from biological growth.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F63, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that water vapour will condense inside exhaust ducts, which could lead to the leakage of condensation from joints or at inlets, which could lead to the corrosion or rotting of structural building elements, which could lead to structural failure, which could lead to harm to persons.

**Provision: 9.32.3.11.(4)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that water vapour will condense on the interior surface of ducts, which could lead to:

- the deterioration of ducts, which could lead to the blockage of ducts (e.g. ducts collapsing due to corrosion), which could lead to inadequate ventilation, or
- the generation of pollutants from biological growth.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.11.(5)**

---

#### **Objective**

OH1

#### **Attributions**

[F41, F82-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that grease and embedded dust will accumulate in ducts, which could lead to:

- the blockage of ducts and outlets, which could lead to an inadequate exhaust capacity, or
- the generation of pollutants from biological growth.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F01, F82-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that grease and embedded dust will accumulate in ducts, which could lead to:

- the ignition of grease and dust by excessive heat or a kitchen fire, which could lead to the growth and spread of fire, or
- the accumulated grease melting and dripping onto hot cooktop surfaces, which could lead to fire.

This is to limit the probability of harm to persons.

### **Provision: 9.32.3.11.(6)**

---

#### **Objective**

OS1

#### **Attributions**

9.32.3.11.(6)(a), 9.32.3.11.(6)(b), 9.32.3.11.(6)(c) [F02, F03-OS1.1]

9.32.3.11.(6)(a) [F80-OS1.1]

9.32.3.11.(6)(c) [F82-OS1.1]

#### **Intent(s)**

*Intent 1.* [Clause (a)] To limit the probability of melting or burning of the duct on exposure to heat from a fire or to corrosion, which could lead to the perforation of the duct, which could lead to the growth and spread of fire, which could lead to harm to persons.

*Intent 2.* [Clauses (b) and (c)] To limit the probability of the entry and accumulation of grease and embedded dust in the exhaust fans or ducts.

This is to limit the probability that, in the event of a cooktop appliance fire, the ductwork will contribute to the spread of flame and smoke, which could lead to harm to persons.

**Provision: 9.32.3.11.(7)**

---

**Objective**

OH1

**Attributions**

[F41, F53, F80-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the cross-sectional area of the ductwork will be reduced by crushing, which could lead to a reduced volume of air distribution in the ductwork, which could lead to:

- excessive negative or positive indoor air pressure from an unbalanced system, or
- reduced exhaust capacity, which could lead to inadequate ventilation.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To limit the probability of excessive sagging, movement or vibration, which could lead to:

- the accumulation of condensed water vapour in outdoor air supply ducts, or
- the opening of joints, which could lead to:
  - the leakage of exhaust air and pollutants into living space, or
  - the leakage of water vapour into unheated space.

This is to limit the probability of the generation of pollutants from biological growth, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.32.3.11.(8)**

---

**Objective**

OH1

**Attributions**

[F40, F41-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of:

- the leakage of exhaust air and pollutants into living space,
- the leakage of water vapour into unheated space, which could lead to the generation of pollutants from biological growth, or
- supply or exhaust air not reaching its target destination.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F40, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that humid air will leak through the duct joints, which could lead to condensation within the building envelope, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.32.3.11.(9)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52, F53-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- where both exhaust and supply ducts are undersized, inadequate ventilation,
- where supply ducts alone are undersized, excessive negative pressure, or
- where exhaust ducts alone are undersized, excessive positive pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- condensation within assemblies,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon), or
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- pollutant ingress (including combustion products and soil gases).

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To expand the application of Subsection 9.33.4. to ducts in residential occupancies where the size of a duct cannot be determined using Table 9.32.3.11.-A or 9.32.3.11.-B

---

#### **Objective**

OS3

#### **Attributions**

[F53-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive negative pressure, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To expand the application of Subsection 9.33.4. to ducts in residential occupancies where the size of a duct cannot be determined using Table 9.32.3.11.-A or 9.32.3.11.-B

### **Provision: 9.32.3.11.(10)**

---

#### **Intent(s)**

*Intent 1.* To clarify how to use Table 9.32.3.11.-A

**Provision: 9.32.3.11.(11)**

---

**Intent(s)**

*Intent 1.* To clarify how to use Table 9.32.3.11.-A to size flexible duct.

---

**Objective**

OH1

**Attributions**

[F40, F50, F52, F53-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of:

- where both exhaust and supply ducts are undersized, inadequate ventilation,
- where supply ducts alone are undersized, excessive negative pressure, or
- where exhaust ducts alone are undersized, excessive positive pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- condensation within assemblies,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon), or
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- pollutant ingress (including combustion products and soil gases).

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of excessive negative pressure, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.32.3.12.(1)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To state the application of Article 9.32.3.12.

---

### **Provision: 9.32.3.12.(2)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that:

- the outdoor air supply from a heat recovery ventilator will exit a building through another heat recovery ventilator that is not operating, which could lead to an inadequate distribution of fresh air to the intended rooms or spaces, or
- the airflow of another heat recovery ventilator will be disrupted.

This is to limit the probability of inadequate ventilation, which could lead to the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.32.3.12.(3)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the exhaust side of a heat recovery ventilator drawing air through another non-operating heat recovery ventilator, which could lead to a reduced volume of air being exhausted through the intended exhaust duct.

This is to limit the probability of inadequate ventilation, which could lead to the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.32.3.12.(4)**

**Objective**

OH1

**Attributions**

[F53-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of unbalanced airflow, inadequate airflow or some other malfunction, which could lead to:

- where both exhaust and supply streams are affected, inadequate ventilation,
- where supply streams alone are affected, excessive negative pressure, or
- where the exhaust stream alone is affected, excessive positive pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- condensation within assemblies, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- drafts.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F53, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inappropriate or incomplete start-up procedures, which could lead to unbalanced airflow, which could lead to excessive positive pressure, which could lead to condensation within assemblies, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

**Objective**

OS3

**Attributions**

[F43, F53-OS3.4]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inappropriate or incomplete start-up procedures, which could lead to unbalanced airflow, inadequate airflow or some other malfunction, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.12.(5)**

#### **Objective**

OH1

#### **Attributions**

[F62-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the accumulation of condensate in the exhaust-air side of heat recovery ventilators, which could lead to:

- the freezing of condensate, which could lead to the blockage of condensate drains, which could lead to inadequate ventilation, or
- leakage between exhaust and supply airstreams, which could lead to the generation of pollutants from biological growth and their entry into living space.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.32.3.12.(6)**

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that condensate will freeze on heat recovery ventilator components, which could lead to the premature failure of motors or fans, which could lead to a loss of ventilation capacity.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.32.3.13.(1)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the contamination of ventilation air with exhaust air.

This is to limit the probability of the inadequate control of:

- airborne pollutants,
- oxygen and other components necessary for breathable air, or
- relative humidity, which could lead to condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F40, F44, F50-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of the contamination of ventilation air with carbon monoxide gas from automobile exhausts, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.32.3.13.(2)**

---

**Objective**

OH1

**Attributions**

[F40, F50, F52, F53-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient vertical clearance, which could lead to:

- the blockage of intake openings by accumulated snow, or
- the ingress of dust or grass clippings.

This is to limit the probability of an inadequate supply of makeup air, which could lead to excessive negative pressure in dwelling units, which could lead to:

- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F43, F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient vertical clearance, which could lead to:

- the blockage of intake openings by accumulated snow, or
- the ingress of dust or grass clippings.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of an inadequate supply of makeup air, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.13.(3)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient vertical and horizontal clearances, which could lead to the contamination of ventilation air with pollutants vented from buildings through the building envelope, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F40, F50, F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient vertical and horizontal clearances, which could lead to the contamination of ventilation air with pollutants vented from buildings through the building envelope (such as carbon monoxide gas from gas vents), which could lead to the acute poisoning or asphyxiation of persons.

---

### **Provision: 9.32.3.13.(4)**

#### **Objective**

OH1

#### **Attributions**

[F40, F50, F52-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- the inadvertent blockage of intake openings, which could lead to inadequate makeup air, which could lead to excessive negative pressure in dwelling units, or
- the introduction of airborne contaminants near an intake opening.

This is to limit the probability of:

- the inadequate control of airborne pollutants,
- the ingress of soil gases (such as methane and radon),
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, or
- moisture ingress from the ground, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F40, F44, F50, F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of the inadvertent blockage of an intake opening or the introduction of airborne contaminants near an intake opening, which could lead to an inadequate supply of makeup air, which could lead to excessive negative pressure in dwelling units, which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.32.3.13.(5)**

---

**Objective**

OH1

**Attributions**

[F40, F53-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient vertical clearance, which could lead to the blockage of exhaust openings by vegetation, earth or debris, which could lead to inadequate exhaust airflow, which could lead to excessive positive pressure in dwelling units, which could lead to:

- the inadequate control of airborne pollutants, or
- condensation within assemblies.

This is to limit the probability of the generation of pollutants from biological growth or from materials that become unstable on wetting, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.32.3.13.(6)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ingress of precipitation into the ventilation system, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of the ingress of precipitation into the ventilation system, which could lead to the deterioration of building elements, which could lead to structural failure, which could lead to harm to persons.

---

### **Provision: 9.32.3.13.(7)**

#### **Objective**

OH1

#### **Attributions**

[F42-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the entry of vermin or insects into buildings, which could lead to the introduction of disease organisms, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F01, F42-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the entry of vermin (such as mice, rats or squirrels) into buildings, which could lead to damage to electrical wiring, which could lead to the ignition of combustible materials, which could lead to harm to persons.

---

#### **Objective**

OH2

#### **Attributions**

[F42-OH2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of the entry of vermin or insects into buildings, which could lead to unsanitary conditions, which could lead to harm to persons.

---

### **Provision: 9.32.3.13.(8)**

#### **Objective**

OH1

#### **Attributions**

[F42, F63-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- the entry of cold air into buildings (backdraft) through exhaust outlets that are subjected to positive wind pressure when fans are not operating, which could lead to the excessive cooling of exhaust ducts, which could lead to the condensation of water vapour on the exterior surfaces of such ducts, which could lead to the generation of pollutants from biological growth, or

---

## Intent Statements: NBC 2010

- the entry of vermin into buildings, which could lead to the introduction of disease organisms.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To exempt exhaust outlets serving heat recovery ventilators from the requirement to install backdraft dampers, on the basis that the internal resistance of the heat recovery ventilator core provides sufficient resistance to backdraft.

---

### Objective

OS1

### Attributions

[F01, F42-OS1.1]

### Intent(s)

*Intent 1.* To limit the probability of the entry of vermin (such as mice, rats or squirrels) into buildings, which could lead to damage to electrical wiring, which could lead to the ignition of combustible materials, which could lead to harm to persons.

*Intent 2.* To exempt exhaust outlets serving heat recovery ventilators from the requirement to install backdraft dampers, on the basis that the internal resistance of the heat recovery ventilator core provides sufficient resistance to backdraft.

---

### Provision: 9.32.3.13.(9)

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that screens or grilles on air intake or exhaust openings will become blocked due to lack of maintenance, which could lead to:

- where both exhaust and supply fans are restricted, inadequate ventilation,
- where exhaust fans alone are restricted, excessive positive pressure, or
- where supply fans alone are restricted, excessive negative pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- condensation within assemblies,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon), or
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- pollutant ingress (including combustion products and soil gases).

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

## **Provision: 9.32.3.13.(11)**

---

### **Objective**

OH1

### **Attributions**

[F53, F81-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of excessive restriction of airflow through screens or grilles on air intake or exhaust openings, which could lead to:

- where both exhaust and supply fans are restricted, inadequate ventilation,
- where exhaust fans alone are restricted, excessive positive pressure, or
- where supply fans alone are restricted, excessive negative pressure.

This is to limit the probability of:

- the inadequate control of airborne pollutants or oxygen and other components necessary for breathable air,
- the inadequate control of relative humidity, which could lead to condensation on interior surfaces,
- condensation within assemblies,
- moisture ingress from the ground,
- the ingress of soil gases (such as methane and radon), or
- the spillage of combustion products from fuel-burning appliances that are susceptible to spillage.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- pollutant ingress (including combustion products and soil gases).

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F43, F53-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of excessive restriction of airflow through screens or grilles on air intake or exhaust openings, which could lead to excessive negative pressure (where supply fans alone are restricted), which could lead to the spillage of carbon monoxide gas from fuel-burning appliances that are susceptible to spillage, which could lead to the acute poisoning or asphyxiation of persons.

---

**Provision: 9.32.3.13.(12)**

---

**Objective**

OH2

**Attributions**

[F42, F80-OH2.5]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of screens or grilles on air intake or exhaust openings, which could lead to the entry of vermin or insects into buildings, which could lead to unsanitary conditions, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F01, F42, F80-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the premature failure of screens or grilles on air intake or exhaust openings, which could lead to the entry of vermin (such as mice, rats or squirrels) into buildings, which

---

## **Intent Statements: NBC 2010**

could lead to damage to electrical wiring, which could lead to the ignition of combustible materials, which could lead to harm to persons.

---

### **Provision: 9.33.1.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Subsections 9.33.3. to 9.33.10.

---

### **Provision: 9.33.1.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To limit the application of Section 9.33. to the design and installation of heating and air-conditioning systems in individual dwelling units and radiant heating systems in houses with secondary suites in Part 9 buildings and to expand the application of Part 6 to include all other heating and air-conditioning systems in Part 9 buildings.

---

### **Provision: 9.33.1.1.(3)**

---

#### **Objective**

OH1

#### **Attributions**

[F40-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the interconnection of ductwork between dwelling units and spaces in a house with a secondary suite will lead to the entry of contaminants into other parts of the house with a secondary suite, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F40-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that the interconnection of ductwork between dwelling units and spaces in a house with a secondary suite will lead to the spread of fire and products of combustion into other parts of the house with a secondary suite, which could lead to smoke inhalation in the event of a fire, which could lead to harm to persons.

---

### **Provision: 9.33.2.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F52-OH1.2] [F63-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to the inadequate control of relative humidity, which could lead to condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the application of Sentence 9.33.1.1.(1) so as to exclude residential buildings that are not occupied in the winter.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to the inadequate control of relative humidity, which could lead to condensation.

This is to limit the probability of deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

*Intent 2.* To limit the application of Sentence 9.33.1.1.(1) so as to exclude residential buildings that are not occupied in the winter.

---

**Provision: 9.33.3.1.(1)**

---

**Objective**

OH1

**Attributions**

[F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that low interior temperatures will lead to the inadequate thermal comfort of persons, which could lead to harm to persons.

---

**Provision: 9.33.3.2.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Article 1.1.3.1., which contains climatic values required for designing heating and air-conditioning systems.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.33.4.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F41, F63-OH1.1] [F51, F52-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of heating or air-conditioning systems, with respect to maintaining indoor air temperatures and relative humidity, will fall significantly below expectations.

This is to limit the probability of the inadequate control of temperatures and relative humidity, which could lead to condensation, which could lead to:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F63-OS2.3] Applies only to heating systems.

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of heating systems, with respect to maintaining the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], will fall significantly below expectations, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4] Applies only to heating systems.

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of heating systems, with respect to the spillage of combustion products from fuel-burning appliances that are susceptible to spillage, will fall significantly below expectations, which could lead to the entry of carbon monoxide gas into living spaces, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.33.4.2.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the installation of hydronic heating systems will fall significantly below expectations, which could lead to:

- the inadequate performance or premature failure of components,
- fuel or gas leaks, or
- overheating of components.

This is to limit the probability of a fire or explosion, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the installation of hydronic heating systems will fall significantly below expectations, which could lead to:

- the inadequate performance or premature failure of components,
- fuel or gas leaks, or
- overheating of components.

This is to limit the probability of a fire or explosion, which could lead to damage to the building.

---

**Objective**

OH1

**Attributions**

[F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the installation of hydronic heating systems will fall significantly below expectations, which could lead to inadequate performance or premature failure, which could lead to an inability to maintain adequate indoor air temperatures, which could lead to condensation.

This is to limit the probability of:

- the inadequate control of relative humidity,
- the generation of pollutants from:
  - harmful micro-organisms and the media they grow on,
  - biological growth, or
  - materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the installation of hydronic heating systems will fall significantly below expectations, which could lead to inadequate performance, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

## **Provision: 9.33.4.3.(1)**

---

### **Objective**

OH1

### **Attributions**

[F51, F52-OH1.2] [F63-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to maintain the minimum indoor air temperatures in each dwelling unit [see Sentence 9.33.3.1.(1)], which could lead to the inadequate control of relative humidity, which could lead to condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Provision: 9.33.4.4.(1)**

---

**Objective**

OH1

**Attributions**

[F82-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate inspection, maintenance, repair or cleaning, which could lead to an inability to maintain adequate indoor air temperatures.

This is to limit the probability of condensation, which could lead to:

- the generation of pollutants from harmful micro-organisms and the media they grow on becoming lodged in equipment, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F82-OS2.3] Applies only to heating systems.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate inspection, maintenance, repair or cleaning, which could lead to an inability to maintain minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F82-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate access for servicing or cleaning, which could lead to:

- the accelerated deterioration of heating or air-conditioning system equipment, or
- the accumulation of dust and debris in system components.

This is to limit the probability of the inadequate performance or failure of equipment, which could lead to components overheating, which could lead to a fire or explosion, which could lead to harm to persons.

---

**Objective**

OP1

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F23-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of rupture or leakage at joints in fuel supply lines, which could lead to the escape of combustible gases or liquids, which could lead to a fire or explosion, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F23-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of rupture or leakage at joints in fuel supply lines, which could lead to the escape of combustible gases or liquids, which could lead to a fire or explosion, which could lead to damage to the building.

**Provision: 9.33.4.7.(2)**

---

**Objective**

OS3

**Attributions**

[F20-OS3.3, OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to seismic movement, which could lead to the overturning of heating and air-conditioning equipment, which could lead to power lines breaking or gas lines, oil lines or water lines rupturing, which could lead to persons being exposed to hot water, electrical shock or noxious gases, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F20-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to seismic movement, which could lead to the overturning of heating and air-conditioning equipment, which could lead to power lines breaking or gas or oil lines rupturing, which could lead to fire, which could lead to harm to persons.

**Provision: 9.33.4.8.(1)**

---

**Objective**

OH1

**Attributions**

[F43-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that asbestos fibres will be dislodged from their matrix by airflow or vibration, which could lead to the entry of asbestos fibres into the airstream, which could lead to harm to persons.

**Provision: 9.33.4.9.(1)**

---

**Objective**

OH1

**Attributions**

[F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that contaminants that may be present in the garage will migrate from the garage into the dwelling unit, which could lead to the accumulation of such contaminants to levels that could pose a risk to human health from long-term exposure, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that contaminants that may be present in the garage will migrate from the garage into the dwelling unit, which could lead to the accumulation of such contaminants to levels that could pose a risk to human health from short-term exposure, which could lead to harm to persons.

---

## **Provision: 9.33.5.1.(1)**

---

### **Objective**

OH1

### **Attributions**

[F63-OH1.1] [F51-OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that heating appliances will have an inadequate capacity, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To clarify which indoor and outdoor design temperatures apply.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that heating appliances will have an inadequate capacity, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

*Intent 2.* To clarify which indoor and outdoor design temperatures apply.

**Provision: 9.33.5.2.(1)**

**Objective**

OP1

**Attributions**

[F01-OP1.1] Applies to heating equipment.

**Intent(s)**

*Intent 1.* To limit the probability that the installation of heating equipment will fall significantly below expectations, which could lead to:

- the inadequate performance or failure of components,
- fuel or gas leaks, or
- overheating of components.

This is to limit the probability of a fire or explosion, which could lead to damage to the building.

**Objective**

OH1

**Attributions**

[F41, F63, F50-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the installation of heating or air-conditioning equipment and coupled ventilation systems will fall significantly below expectations, which could lead to inadequate performance or failure, which could lead to:

- an inability to maintain adequate indoor air temperatures, which could lead to condensation, or
- the inadequate replacement of indoor air with outdoor air or the distribution of outdoor air.

This is to limit the probability of:

- the inadequate control of relative humidity,
- the generation of pollutants from:
  - harmful micro-organisms and the media they grow on,
  - biological growth, or
  - materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F63-OS2.3] Applies to heating equipment.

**Intent(s)**

*Intent 1.* To limit the probability that the installation of heating equipment will fall significantly below expectations, which could lead to inadequate performance, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation,

---

## **Intent Statements: NBC 2010**

which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F44-OS3.4] Applies to heating equipment.

### **Intent(s)**

*Intent 1.* To limit the probability that the installation of heating equipment will fall significantly below expectations, which could lead to inadequate performance, which could lead to the entry of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1] Applies to heating equipment.

### **Intent(s)**

*Intent 1.* To limit the probability that the installation of heating equipment will fall significantly below expectations, which could lead to:

- the inadequate performance or failure of components,
- fuel or gas leaks, or
- overheating of components.

This is to limit the probability of a fire or explosion, which could lead to harm to persons.

---

## **Provision: 9.33.5.3.(1)**

---

### **Objective**

OH1

### **Attributions**

[F41, F43-OH1.1] [F51-OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- insufficient combustion air, which could lead to incomplete combustion, which could lead to the spillage of combustion products into living space,
- the accumulation of contaminants,
- the inadequate control of temperatures and relative humidity, or
- condensation, which could lead to:
  - the generation of pollutants from biological growth or materials that become unstable on wetting, or
  - the deterioration of building elements, which could lead to compromised performance of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F51-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the design, construction and installation of solid-fuel-burning appliances will fall significantly below expectations, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F43-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient volume of combustion air, which could lead to the incomplete combustion of solid fuel, which could lead to the entry of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the design, construction and installation of solid-fuel-burning appliances will fall significantly below expectations, which could lead to such appliances not performing in the way intended, which could lead to a fire or explosion, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the design, construction and installation of solid-fuel-burning appliances will fall significantly below expectations, which could lead to such appliances not performing in the way intended, which could lead to a fire or explosion, which could lead to damage to the building.

**Provision: 9.33.5.4.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.22., which contains requirements for factory-built and site-built fireplaces.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.33.6.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.33.6.

### **Provision: 9.33.6.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Part 6 and Subsection 3.6.5. to include the design, construction and installation of air duct distribution systems that serve a higher heat input than 120 kW in Part 9 buildings.

### **Provision: 9.33.6.2.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible building elements, which could lead to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F01-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible building elements, which could lead to the spread of fire and smoke throughout the building, which could lead to damage to the building.

### **Provision: 9.33.6.2.(2)**

---

#### **Objective**

OS1

#### **Attributions**

9.33.6.2.(2)(a), 9.33.6.2.(2)(b), 9.33.6.2.(2)(c), 9.33.6.2.(2)(d) [F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To exempt ducts, associated fittings and plenums from the application of Sentence 9.33.6.2.(1), where certain criteria are met.

This is to limit the probability of the ignition of combustible duct system components, which could lead to the spread fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

9.33.6.2.(2)(a), 9.33.6.2.(2)(b), 9.33.6.2.(2)(c), 9.33.6.2.(2)(d) [F01-OP1.1]

**Intent(s)**

*Intent 1.* To exempt ducts, associated fittings and plenums from the application of Sentence 9.33.6.2.(1), where certain criteria are met.

This is to limit the probability of the ignition of combustible duct system components, which could lead to the spread fire and smoke throughout the building, which could lead to damage to the building.

**Provision: 9.33.6.2.(3)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that duct sealants will ignite, which could lead to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that duct sealants will ignite, which could lead to the spread of fire and smoke throughout the building, which could lead to damage to the building.

**Provision: 9.33.6.2.(4)**

---

**Objective**

OS1

**Attributions**

9.33.6.2.(4)(a), 9.33.6.2.(4)(b), 9.33.6.2.(4)(c), 9.33.6.2.(4)(d) [F01-OS1.1]

**Intent(s)**

*Intent 1.* To exempt duct connectors from the application of Sentence 9.33.6.2.(1), where certain criteria are met.

This is to limit the probability of the ignition of combustible duct system components, which could lead to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

9.33.6.2.(4)(a), 9.33.6.2.(4)(b), 9.33.6.2.(4)(c), 9.33.6.2.(4)(d) [F01-OP1.1]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To exempt duct connectors from the application of Sentence 9.33.6.2.(1), where certain criteria are met.

This is to limit the probability of the ignition of combustible duct system components, which could lead to the spread of fire and smoke throughout the building, which could lead to damage to the building.

---

### **Provision: 9.33.6.2.(5)**

### **Intent(s)**

*Intent 1.* To exempt combustible ducts from the application of Sentences 9.33.6.2.(1) to 9.33.6.2.(4), where such ducts are unlikely to be exposed to high temperatures and will not contribute to the spread of fire and smoke to other parts of the building.

---

### **Provision: 9.33.6.2.(6)**

### **Intent(s)**

*Intent 1.* To exempt combustible ducts from the application of Sentences 9.33.6.2.(1) to 9.33.6.2.(4), where such ducts are unlikely to be exposed to high temperatures and will not contribute to the spread of fire and smoke to other parts of the building.

---

### **Provision: 9.33.6.2.(7)**

### **Objective**

OH1

### **Attributions**

9.33.6.2.(7)(a), 9.33.6.2.(7)(b) [F41, F63-OH1.1] [F50, F51, F52-OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of the deterioration and collapse of ducts, which could lead to reduced airflow, which could lead to an inadequate delivery of air, which could lead to:

- inadequate ventilation,
- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- an inadequate supply of combustion air, which could lead to incomplete combustion.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, and oxygen and other components necessary for breathable air,
- condensation, which could lead to:
  - the generation of pollutants from biological growth or from materials that become unstable on wetting, or
  - the deterioration of building elements, or
- the entry of combustion products into living space.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

9.33.6.2.(7)(a), 9.33.6.2.(7)(b) [F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture or corrosion resistance, which could lead to the deterioration and collapse of ducts, which could lead to reduced airflow, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

**Provision: 9.33.6.3.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material, which could lead to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material, which could lead to the spread of fire and smoke throughout the building, which could lead to damage to the building.

---

**Provision: 9.33.6.4.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material, which could lead to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of the ignition of combustible material, which could lead to the spread of fire and smoke throughout the building, which could lead to damage to the building.

### **Provision: 9.33.6.4.(2)**

---

#### **Objective**

OS1

#### **Attributions**

9.33.6.4.(2)(a), 9.33.6.4.(2)(b) [F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that combustible coverings, linings and associated adhesives and insulation will contribute to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

9.33.6.4.(2)(a), 9.33.6.4.(2)(b) [F01-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that combustible coverings, linings and associated adhesives and insulation will contribute to the spread of fire and smoke throughout the building, which could lead to damage to the building.

### **Provision: 9.33.6.4.(3)**

---

#### **Objective**

OS1

#### **Attributions**

9.33.6.4.(3)(a), 9.33.6.4.(3)(b) [F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that covering materials will contribute to the spread of fire and smoke throughout the building, which could lead to harm to persons.

*Intent 2.* To expand the application of Sentence 9.33.6.4.(2) to include situations where coverings and linings used in air duct systems are installed within an assembly of combustible construction.

---

#### **Objective**

OP1

#### **Attributions**

9.33.6.4.(3)(a), 9.33.6.4.(3)(b) [F01-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that covering materials will contribute to the spread of fire and smoke throughout the building, which could lead to damage to the building.

*Intent 2.* To expand the application of Sentence 9.33.6.4.(2) to include situations where coverings and linings used in air duct systems are installed within an assembly of combustible construction.

**Provision: 9.33.6.4.(4)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of combustible coverings or linings will fall significantly below expectations, which could lead to their contributing to the spread of fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of combustible coverings or linings will fall significantly below expectations, which could lead to their contributing to the spread of fire and smoke throughout the building, which could lead to damage to the building.

**Provision: 9.33.6.4.(5)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that foamed plastic, once ignited, will contribute to the rapid spread of fire and smoke throughout the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that foamed plastic, once ignited, will contribute to the rapid spread of fire and smoke throughout the building, which could lead to damage to the building.

**Provision: 9.33.6.4.(6)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that foamed plastic, once ignited, will contribute to the rapid spread of fire and smoke throughout the building, which could lead to harm to persons.

*Intent 2.* To expand the application of Sentence 9.33.6.4.(5) to include situations where the foamed plastic insulation is protected from exposure to the plenum by an acceptable thermal barrier.

*Intent 3.* To expand the application of Sentence 3.1.5.12.(2).

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that foamed plastic, once ignited, will contribute to the rapid spread of fire and smoke throughout the building, which could lead to damage to the building.

*Intent 2.* To expand the application of Sentence 9.33.6.4.(5) to include situations where the foamed plastic insulation is protected from exposure to the plenum by an acceptable thermal barrier.

*Intent 3.* To expand the application of Sentence 3.1.5.12.(2).

---

## **Provision: 9.33.6.4.(7)**

---

### **Objective**

OS1

### **Attributions**

9.33.6.4.(7)(a), 9.33.6.4.(7)(b) [F01, F03-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- combustible coverings and linings of ducts, adhesives and insulation being exposed to elevated temperatures, which could lead to fire, or
- combustible material that has ignited contributing to the spread of fire from one fire compartment to another.

This is to limit the probability of harm to persons.

---

### **Objective**

OP1

### **Attributions**

9.33.6.4.(7)(a), 9.33.6.4.(7)(b) [F01, F03-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- combustible coverings and linings of ducts, adhesives and insulation being exposed to elevated temperatures, which could lead to fire, or
- combustible material that has ignited contributing to the spread of fire from one fire compartment to another.

This is to limit the probability of damage to the building.

**Provision: 9.33.6.4.(8)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1] Applies to ventilation ducts and their fittings.

[F51, F52-OH1.2] Applies to air duct distribution systems serving heating systems.

**Intent(s)**

*Intent 1.* To limit the probability that duct lining will interfere with the opening or closing of dampers, which could lead to an inability to balance the flow of intake and exhaust air, which could lead to:

- an inadequate delivery of warm air or return of cold air, or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity,
- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, or
- inadequate combustion air for fuel-burning appliances.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- incomplete combustion.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F03-OS1.1] Applies to air duct distribution systems.

**Intent(s)**

*Intent 1.* To limit the probability that duct lining will interfere with the opening or closing of fire dampers, which could lead to an inability to retard the spread of fire and smoke to other parts of the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.1] Applies to air duct distribution systems.

**Intent(s)**

*Intent 1.* To limit the probability that duct lining will interfere with the opening or closing of fire dampers, which could lead to an inability to retard the spread of fire and smoke to other parts of the building, which could lead to damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3] Applies to air duct distribution systems.

### **Intent(s)**

*Intent 1.* To limit the probability that duct lining will interfere with the opening or closing of dampers, which could lead to an inability to balance the flow of intake and exhaust air, which could lead to an inability to maintain adequate indoor air temperatures, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

## **Provision: 9.33.6.5.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of damage to or premature failure of ducts, which could lead to:

- an inadequate delivery of warm air or return of cold air, or
- inadequate ventilation.

This is to limit the probability of:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, or
- the inadequate control of airborne pollutants or relative humidity.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of damage to or premature failure of ducts, which could lead to exposure to heat radiated from supply ducts and furnace heat exchangers, which could lead to the ignition of combustible building materials, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of damage to or premature failure of ducts, which could lead to exposure to heat radiated from the supply duct and furnace heat exchanger, which could lead to the ignition of combustible building materials, which could lead to damage to the building.

**Provision: 9.33.6.5.(2)**

---

**Objective**

OH1

**Attributions**

[F20, F63-OH1.1] [F20, F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of fittings for ducts will fall significantly below expectations, which could lead to the dislodgement or failure of ducts, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation,
- an inadequate delivery of warm air or return of cold air, or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of temperatures, airborne pollutants or relative humidity, or
- inadequate combustion air for fuel-burning appliances.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- incomplete combustion.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of fittings for ducts will fall significantly below expectations, which could lead to the dislodgement or failure of ducts, which could lead to an inability

---

## **Intent Statements: NBC 2010**

to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

### **Provision: 9.33.6.6.(1)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the spread of fire and smoke to other parts of the building by way of the concealed space, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the spread of fire and smoke to other parts of the building by way of the concealed space, which could lead to damage to the building.

---

### **Provision: 9.33.6.6.(2)**

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- sagging or misaligned ducts, which could lead to inadequate clearances, which could lead to the ignition of combustible materials, or
- the ignition of duct supports from the heat transferred from the ducts.

This is to limit the probability of fire, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F20-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that inadequate support will lead to the collapse of ducts, which could lead to falling parts, which could lead to harm to persons. [See Sentence 9.33.6.7.(3) for the requirement regarding the support of branch ducts.]

---

**Objective**

OH1

**Attributions**

[F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of sagging and misalignment or opening of joints, which could lead to:

- an inadequate delivery of warm air or return of cold air, or
- inadequate ventilation.

This is to limit the probability of:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, or
- inadequate combustion air for fuel-burning appliances.

This is to limit the probability of:

- the inadequate control of temperatures, airborne pollutants or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- incomplete combustion.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of sagging and misalignment or opening of joints, which could lead to inadequate air distribution, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

**Provision: 9.33.6.6.(3)**

---

**Objective**

OH1

**Attributions**

[F43, F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of excessive air leakage, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation,

---

## **Intent Statements: NBC 2010**

- inadequate ventilation, or
- inadequate combustion air for fuel-burning appliances, which could lead to incomplete combustion.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- the entry of combustion products into living space.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of joints opening, which could lead to combustible building elements being exposed to heat radiated from furnace heat exchangers, which could lead to fire, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of excessive air leakage, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of joints opening, which could lead to combustible building elements being exposed to heat radiated from furnace heat exchangers, which could lead to fire, which could lead to damage to the building.

**Provision: 9.33.6.6.(4)**

**Objective**

OH1

**Attributions**

[F43, F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of excessive air leakage, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation,
- inadequate ventilation, or
- inadequate combustion air for fuel-burning appliances, which could lead to incomplete combustion.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- the entry of combustion products into living space.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Objective**

OS2

---

**Objective**

OH1

**Attributions**

[F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of excessive sagging and misalignment or opening of joints, which could lead to excessive air leakage, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- inadequate combustion air for fuel-burning appliances, which could lead to incomplete combustion.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- the entry of combustion products into living space.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for branch ducts, which could lead to excessive sagging and misalignment or opening of joints, which could lead to excessive air leakage, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that inadequate support for branch ducts will lead to the collapse of ducts, which could lead to harm to persons. [See Sentence 9.33.6.7.(3) for the requirement regarding support of branch ducts.]

### **Provision: 9.33.6.7.(4)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F52-OH1.2] [F63, F50-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the escape of water vapour from ducts, which could lead to such vapour condensing and freezing on duct surfaces or within insulation, which could lead to:

- the wetting of building elements, which could lead to corrosion, rotting or mould and mildew growth, or
- the sagging and collapse of ducts.

This is to limit the probability of:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- inadequate combustion air for fuel-burning appliances, which could lead to incomplete combustion.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- the entry of combustion products into living space.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F63, F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the escape of water vapour from ducts, which could lead to such vapour condensing and freezing on duct surfaces or within insulation, which could lead to the wetting of building elements, which could lead to corrosion, rotting or mould and mildew growth, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

**Provision: 9.33.6.7.(5)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of exposure to hot air in the vicinity of furnace heat exchangers, to heat radiated from furnace heat exchangers, or to embers or flames from objects dropped into registers, which could lead to the ignition of combustible duct material, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of exposure to hot air in the vicinity of furnace heat exchangers, to heat radiated from furnace heat exchangers, or to embers or flames from objects dropped into registers, which could lead to the ignition of combustible duct material, which could lead to damage to the building.

**Provision: 9.33.6.7.(6)**

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- the entry of groundwater into ducts, or
- accelerated deterioration, which could lead to air leakage from ducts or the collapse of ducts.

This is to limit the probability of:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- inadequate combustion air for fuel-burning appliances, which could lead to incomplete combustion.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- the entry of combustion products into living space.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or

---

## **Intent Statements: NBC 2010**

- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F80-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- the entry of groundwater into ducts, or
- accelerated deterioration, which could lead to air leakage from ducts or the collapse of ducts.

This is to limit the probability of an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

## **Provision: 9.33.6.7.(7)**

---

### **Objective**

OH1

### **Attributions**

9.33.6.7.(7)(a), 9.33.6.7.(7)(b) [F40, F62-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of the accumulation of water in ducts, which could lead to:

- excessive relative humidity, or
- the accelerated deterioration of ducts.

This is to limit the probability of the generation of pollutants from biological growth or from materials that become unstable on wetting, which could lead to:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of the entry of sewer gases into duct systems, which could, on system operation, lead to the distribution of sewer gases throughout living spaces, which could lead negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

9.33.6.7.(7)(a), 9.33.6.7.(7)(b) [F40, F62-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage, which could lead to the accumulation of water in ducts, which could lead to:

- excessive relative humidity, or
- the accelerated deterioration of ducts.

This is to limit the probability of deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

9.33.6.7.(7)(b) [F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability of the entry of sewer gases into duct systems, which could, on system operation, lead to the distribution of sewer gases throughout living spaces, which could lead to harm to persons.

---

**Provision: 9.33.6.8.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Sentence 9.33.5.2.(1), which contains requirements regarding the clearance of furnace plenums from combustible material.

---

**Provision: 9.33.6.8.(2)**

---

**Objective**

OS1

**Attributions**

9.33.6.8.(2)(a), 9.33.6.8.(2)(b) [F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material by heat radiated from supply ducts, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

9.33.6.8.(2)(a), 9.33.6.8.(2)(b) [F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material by heat radiated from supply ducts, which could lead to damage to the building.

---

**Provision: 9.33.6.8.(3)**

---

**Objective**

OS1

**Attributions**

9.33.6.8.(3)(a), 9.33.6.8.(3)(b) [F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material by heat radiated from supply ducts, which could lead to harm to persons.

**Provision: 9.33.6.9.(1)**

---

**Objective**

OH1

**Attributions**

[F40, F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

**Intent 1.** To limit the probability of an inability to adjust the airflow from individual ducts, or to balance the flow among the ducts, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**[F63-OS2.3] Applies to branch *supply ducts* that are not fitted with diffusers with adjustable balance stops.**Intent(s)**

**Intent 1.** To limit the probability of an inability to adjust, or to properly adjust, the airflow from individual ducts, or an inability to balance the flow among the ducts, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of environmental separators or elements protected by such separators, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.33.6.10.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F81-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that combustible objects of significant size will end up in ducts, which could lead to the blockage of ducts, which could lead to an increase of the temperature in the ducts, which could lead to fire, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F81-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that objects of significant size will end up in ducts, which could lead to restricted airflow, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- an inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F81-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that objects of significant size will end up in ducts, which could lead to restricted airflow, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

**Provision: 9.33.6.10.(2)**

---

**Objective**

OS1

**Attributions**

9.33.6.10.(2)(a), 9.33.6.10.(2)(b) [F01, F02-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that combustible grilles, diffusers and other devices will contribute to the rapid spread of fire across interior exposed surfaces of walls and ceilings, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

9.33.6.10.(2)(a), 9.33.6.10.(2)(b) [F01, F02-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that combustible grilles, diffusers and other devices will contribute to the rapid spread of fire across interior exposed surfaces of walls and ceilings, which could lead to damage to the building.

**Provision: 9.33.6.11.(1)**

---

**Objective**

OH1

**Attributions**

[F40, F63-OH1.1] [F51, F52-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate delivery of warm air, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

### **Provision: 9.33.6.11.(2)**

---

### **Objective**

OH1

### **Attributions**

[F63-OH1.1] [F51-OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate surface or interstitial temperatures of exterior walls.

This is to limit the probability of condensation, which could lead to:

- the inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of environmental separators or elements protected by such separators, which could lead to deterioration.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of warm air along exterior walls, which could lead to inadequate surface or interstitial temperatures of exterior walls, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

### **Provision: 9.33.6.11.(3)**

---

### **Objective**

OH1

### **Attributions**

[F40, F63-OH1.1] [F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an ineffective mixing of ventilation air with room air, which could lead to stratification near the floor due to the potentially cooler temperature and higher density of ventilation air, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Provision: 9.33.6.11.(4)**

---

**Objective**

OH1

**Attributions**

[F40, F63-OH1.1] [F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of warm air in basement spaces, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F63-OS2.3]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of warm air in basement spaces, which could lead to temperatures in certain areas of the basement falling below the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of environmental separators or elements protected by such separators, which could lead to harm to persons.

---

### **Provision: 9.33.6.11.(5)**

#### **Objective**

OH1

#### **Attributions**

[F40, F63-OH1.1] [F51-OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate number or placement of warm-air supply outlets, which could lead to an inadequate distribution of warm air in crawl spaces, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate number or placement of warm-air supply outlets, which could lead to an inadequate distribution of warm air in crawl spaces, which could lead to temperatures in certain areas of the basement falling below the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

**Provision: 9.33.6.11.(6)**

---

**Objective**

OH1

**Attributions**

[F40, F63-OH1.1] [F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity,
- condensation, or
- inadequate combustion air for fuel-burning appliances.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- the deterioration of building elements, or
- incomplete combustion.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- warm-air supply outlets with an inadequate total capacity, or
- an inadequate number of warm-air supply outlets in large spaces.

This is to limit the probability of an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

**Provision: 9.33.6.11.(7)**

---

**Intent(s)**

*Intent 1.* To clarify that heat gained by radiation from duct and plenum surfaces is permitted to, in effect, reduce the heat loss used to calculate the size of supply ducts and location of outlets.

---

9.33.6.13.(4)(a), 9.33.6.13.(4)(b), 9.33.6.13.(4)(c) [F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible return duct material in locations where burning or smouldering objects can fall and remain in contact with the return ducts, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

9.33.6.13.(4)(a), 9.33.6.13.(4)(b), 9.33.6.13.(4)(c) [F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible return duct material in locations where burning or smouldering objects can fall and remain in contact with the return ducts, which could lead to damage to the building.

---

### **Provision: 9.33.6.13.(5)**

---

### **Objective**

OH1

### **Attributions**

[F51, F52-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of a drop in pressure and a reduction in the flow of return air from rooms, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- where required ventilation is provided by the forced-air heating system, inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- condensation, which could lead to:
  - the generation of pollutants from biological growth or from materials that become unstable on wetting,
  - the deterioration of building elements, or
  - compromised performance of environmental separators,

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F51, F52-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the size of ducts will be larger than necessary or that return ducts will be connected to other spaces, which could lead to a drop in pressure, which could lead to a reduction in the flow of return air from rooms, which could lead to an inability to regulate the flow of warm air to rooms, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)] assumed for the purpose of determining minimum required thermal insulation levels [see Sentence 9.25.2.1.(1)], or
- where required ventilation is provided by the forced-air heating system, inadequate ventilation.

This is to limit the probability of condensation, which could lead to the deterioration of building elements, which could lead to compromised structural performance, which could lead to harm to persons.

---

**Provision: 9.33.6.13.(6)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1] [F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of connecting return ducts to rooms on multiple floor levels with different stack pressures, which could lead to an inadequate flow of return air from upper-level rooms, which could lead to an inability to regulate the flow of warm air to rooms, which could lead to:

- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], or
- inadequate ventilation.

This is to limit the probability of:

- the inadequate control of airborne pollutants or relative humidity, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

---

## **Intent Statements: NBC 2010**

- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of connecting return ducts to rooms on multiple floor levels with different stack pressures, which could lead to an inadequate flow of return air from upper-level rooms, which could lead to an inability to regulate the flow of warm air to rooms, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity, which could lead to harm to persons.

---

## **Provision: 9.33.6.13.(7)**

---

### **Objective**

OH1

### **Attributions**

9.33.6.13.(7)(a), 9.33.6.13.(7)(b) [F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that combustion products will be extracted from openings in furnace fire chambers or flue pipes and enter return-air and supply ducts, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

9.33.6.13.(7)(a), 9.33.6.13.(7)(b) [F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability of incomplete combustion, which could lead to the production of carbon monoxide gas, which could lead to the acute poisoning or asphyxiation of persons.

---

## **Provision: 9.33.6.14.(1)**

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that the performance of air filters, with respect to flammability and smoke production, will fall significantly below expectations, which could lead to their igniting and producing unacceptable amounts of smoke under in-service temperatures, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F01-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of air filters, with respect to flammability and smoke production, will fall significantly below expectations, which could lead to their igniting and producing unacceptable amounts of smoke under in-service temperatures, which could lead to damage to the building.

### **Provision: 9.33.6.14.(2)**

---

### **Objective**

OS3

### **Attributions**

[F32-OS3.3]

### **Intent(s)**

*Intent 1.* To limit the probability that electrostatic filters will remain energized while being inspected or removed, which could lead to persons being exposed to electric shock, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F41-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of electric discharge, which could lead to the creation of ozone gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Provision: 9.33.6.14.(3)**

---

### **Objective**

OH1

### **Attributions**

9.33.6.14.(3)(a), 9.33.6.14.(3)(b) [F81-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of dust accumulation on the adsorbing surface, which could lead to a loss of capacity to remove odours, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.33.7.1.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the long-term exposure of combustible materials to relatively low-grade heat, which could lead to the ignition of the combustible materials, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F01-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the long-term exposure of combustible materials to relatively low-grade heat, which could lead to the ignition of the combustible materials, which could lead to damage to the building.

### **Provision: 9.33.7.2.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F31-OS3.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of persons coming in contact with a hot surface, which could lead to harm to persons.

### **Provision: 9.33.8.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F20-OS3.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of rupture of piping in heating and cooling systems that are subjected to the excessive pressure or temperature of the heat exchanger medium, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F20-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of rupture of piping in heating and cooling systems that are subjected to the excessive pressure or temperature of the heat exchanger medium, which could lead to an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation.

This is to limit the probability of:

- the inadequate control of temperatures and relative humidity,
- generation of pollutants from biological growth or materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Provision: 9.33.8.1.(2)**

---

**Objective**

OH1

**Attributions**

[F21, F40-OH1.1] [F21, F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate allowance for expansion and contraction of pipes from heating and cooling during service, which could lead to excessive stress in pipes, which could lead to pipe failure, which could lead to:

- the escape of the heating medium or refrigerant, or
- an inability to maintain the minimum indoor air temperatures [see Sentence 9.33.3.1.(1)], which could lead to condensation.

This is to limit the probability of:

- the inadequate control of temperatures and relative humidity,
- the generation of pollutants from biological growth or materials that become unstable on wetting, or
- the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

**Provision: 9.33.8.1.(3)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.2]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inappropriate design or installation, which could lead to the excessive deflection or failure of structural building elements under gravity loads imposed by piping or loads imposed by the expansion or contraction of piping, which could lead to harm to persons.

---

### **Provision: 9.33.8.2.(1)**

#### **Objective**

OH1

#### **Attributions**

[F80-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate thermal resistance, which could lead to a reduction in the efficiency of heating or cooling equipment, which could lead to the inadequate thermal comfort of persons in the building, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F80-OS3.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of the exposure of high-temperature pipes, which could lead to harm to persons.

---

### **Provision: 9.33.8.2.(2)**

#### **Objective**

OS1

#### **Attributions**

9.33.8.2.(2)(a), 9.33.8.2.(2)(b) [F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to high temperatures, which could lead to the ignition of pipe insulation or coverings, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

9.33.8.2.(2)(a), 9.33.8.2.(2)(b) [F01-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to high temperatures, which could lead to the ignition of pipe insulation or coverings, which could lead to damage to the building.

**Provision: 9.33.8.2.(3)**

---

**Objective**

OS1

**Attributions**

9.33.8.2.(3)(a), 9.33.8.2.(3)(b) [F01, F02-OS1.1, OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of the rapid spread of fire and smoke from one room or space to another, or from one area of a room or space to another, through duct-like concealed spaces, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

9.33.8.2.(3)(a), 9.33.8.2.(3)(b) [F01, F02-OP1.1, OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability of the rapid spread of fire and smoke from one room or space to another, or from one area of a room or space to another, through duct-like concealed spaces, which could lead to damage to the building.

**Provision: 9.33.8.2.(4)**

---

**Objective**

OS1

**Attributions**

[F01, F02-OS1.1, OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of the rapid spread of flame or smoke throughout rooms or spaces other than duct-like concealed spaces, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01, F02-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the rapid spread of flame or smoke throughout rooms or spaces other than duct-like concealed spaces, which could lead to damage to the building.

**Provision: 9.33.8.2.(5)**

---

**Objective**

OS3

**Attributions**

[F31-OS3.2]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of persons coming in contact with hot surfaces, which could lead to harm to persons.

**Provision: 9.33.8.2.(6)**

---

**Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.33.8.2.(4) situations where insulation is unlikely to be exposed to fire and where conditions for sustaining a fire are poor.

**Provision: 9.33.8.3.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material by heat radiated or conducted from high-temperature pipes, which could lead to harm to persons.

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material by heat radiated or conducted from high-temperature pipes, which could lead to damage to the building.

**Provision: 9.33.8.4.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material, which could lead to harm to persons.

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of combustible material, which could lead to damage to the building.

**Provision: 9.33.8.4.(2)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of nearby combustible stored material or of combustible insulation, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the ignition of nearby combustible stored material or of combustible insulation, which could lead to damage to the building.

---

**Provision: 9.33.9.1.(1)**

---

**Objective**

OH1

**Attributions**

9.33.9.1.(1)(a), 9.33.9.1.(1)(b), 9.33.9.1.(1)(c) [F43-OH1.1] [F51-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate placement of cooling system evaporator coils, which could lead to overheating of the evaporator coil, which could lead to an increase in pressure, which could lead to:

- the rupture of the coil and loss of refrigerant gases, or
- the inadequate operation of cooling systems.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, or
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Provision: 9.33.10.1.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Sentences 9.33.5.2.(1) and 9.33.5.3.(1), which list installation standards for oil-, gas- and solid-fuel-burning appliances and require conformance to those standards.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.33.10.2.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of factory-built chimneys will fall significantly below expectations, which could lead to excessive radiant heat loss, which could lead to failure at joints or to burn-through, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of factory-built chimneys will fall significantly below expectations, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

#### **Objective**

OH1

#### **Attributions**

[F44, F41-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of factory-built chimneys will fall significantly below expectations, which could lead to the leakage of flue gases into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F01-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of factory-built chimneys will fall significantly below expectations, which could lead to excessive radiant heat loss, which could lead to failure at joints or to burn-through, which could lead to the ignition of combustible building components, which could lead to damage to the building.

### **Provision: 9.33.10.3.(1)**

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.21., which contains requirements regarding chimneys and flues.

**Provision: 9.34.1.1.(1)**

---

**Objective**

OS3

**Attributions**

[F32-OS3.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of electrical installations will fall significantly below expectations, which could lead to electrical shock, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of electrical installations will fall significantly below expectations, which could lead to overheating of components, which could lead to fire, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of electrical installations will fall significantly below expectations, which could lead to overheating of components, which could lead to fire, which could lead to damage to the building.

**Provision: 9.34.1.2.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.34.

**Provision: 9.34.1.3.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.1] [F32-OS3.3]

**Intent(s)**

*Intent 1.* To limit the probability of unauthorized access to electrical equipment that controls lighting inside and outside buildings, which could lead to extinguishing of lighting fixtures, which could lead to inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping, colliding or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To limit the probability of unauthorized access to electrical-supply-related or other equipment, which could lead to electric shock, which could lead to harm to persons.

### **Provision: 9.34.1.4.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive heat buildup in the vicinity of recessed lighting fixtures, which could lead to the ignition of combustible building elements, which could lead to harm to persons.

### **Provision: 9.34.1.5.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F02-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread along the surface of optical fibre cables and electrical wires and cables, which could contribute to fire growth and spread, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F02-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread along the surface of optical fibre cables and electrical wires and cables, which could contribute to fire growth and spread, which could lead to damage to the building.

### **Provision: 9.34.1.5.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Clause 3.6.4.3.(1)(a) to include certain concealed spaces in Part 9 buildings.

### **Provision: 9.34.1.5.(3)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain cables and wires within plenum spaces from the requirements of Sentence 9.34.1.5.(2), if certain conditions are met.

**Provision: 9.34.2.1.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate lighting for persons entering or exiting buildings, or
- persons being unable to turn on lights before exiting buildings.

This is to limit the probability that persons will be unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Objective**

OS4

**Attributions**

[F34-OS4.2]

**Intent(s)**

*Intent 1.* To limit the probability that persons will be unable to see intruders who might be waiting near a building entrance, which could lead to unwanted entry, which could lead to harm to persons.

**Provision: 9.34.2.2.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

**Provision: 9.34.2.2.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability that persons will be unable to connect a light fixture, which could lead to inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.34.2.3.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see stairs, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.3.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will be unable to control stairway lighting from both the bottom and top of stairs, which could lead to inadequate lighting of stairways, which could lead to persons being unable to see stairs, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.3.(3)**

#### **Intent(s)**

*Intent 1.* To exempt situations from the application of Sentence 9.34.2.3.(2), where stairways lead to unfinished basements that are infrequently entered or where stairways are not the sole access to exit.

---

### **Provision: 9.34.2.4.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.4.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of occupants being required to enter an inadequately lit basement in order to turn on a lighting fixture, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.5.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.6.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.6.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.6.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.34.2.6.(4)**

#### **Intent(s)**

*Intent 1.* To supersede the application of Sentence 9.34.2.6.(1) in situations where carports are lighted by other, nearby required lighting fixtures.

---

### **Provision: 9.34.2.7.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lighting, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.7.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate illumination or inadequate lighting power density provided by incandescent lighting fixtures, which could lead to inadequate lighting, during non-emergency use, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.2.7.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate illumination or inadequate lighting power density provided by other than incandescent lighting fixtures, which could lead to inadequate lighting, during non-emergency use, which could lead to persons being unable to see obstructions, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.34.3.1.(1)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.9.12., which contains requirements for emergency lighting.

**Provision: 9.35.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.35.

**Provision: 9.35.1.2.(1)**

---

**Intent(s)**

*Intent 1.* To clarify that the construction of garages and carports is required to conform to the provisions of Part 9 unless otherwise stated in Section 9.35.

**Provision: 9.35.2.1.(1)**

---

**Intent(s)**

*Intent 1.* To define the characteristic that distinguishes garages from carports for the purposes of the Code.

**Provision: 9.35.2.2.(1)**

---

**Objective**

OS1

**Attributions**

[F40-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the accumulation of heavier-than-air flammable gases in garages, which could lead to the flow of such gases into the basement of houses to which garages are attached, which could lead to explosion or fire, which could lead to harm to persons.

**Provision: 9.35.3.1.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Sections 9.12. and 9.15., which contain requirements regarding foundations.

**Provision: 9.35.3.2.(1)**

---

**Objective**

OS2

**Attributions**

[F21-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of differential vertical movement of soil beneath and between the foundations of dwelling units and the foundations of structurally-attached garages or carports, which could lead to damage to foundations.

This is to limit the probability of an inability to support vertical building loads or lateral earth loads, which could lead to:

---

## **Intent Statements: NBC 2010**

- structural failure, or
- compromised structural integrity of elements supported by foundations, which could lead to the failure of environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of differential vertical movement of soil beneath and between the foundations of dwelling units and the foundations of structurally-attached garages or carports, which could lead to damage to foundations.

This is to limit the probability of:

- the ingress of pollutants from the exterior, including soil gas, combustion products from parking garages, and particulates,
- the ingress of precipitation,
- condensation, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F21-OP2.3, OP2.4]

### **Intent(s)**

*Intent 1.* To limit the probability of differential vertical movement of soil beneath and between the foundations of dwelling units and the foundations of structurally-attached garages or carports, which could lead to damage to foundations.

This is to limit the probability of an inability to support vertical building loads or lateral earth loads, which could lead to:

- structural failure, or

- compromised structural integrity of elements supported by foundations, which could lead to the failure of environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of doors or windows, or
- damage to the building.

---

**Objective**

OH4

**Attributions**

[F21-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of differential vertical movement of soil beneath and between the foundations of dwelling units and the foundations of structurally-attached garages or carports, which could lead to damage to foundations.

This is to limit the probability of an inability to support vertical building loads or lateral earth loads, which could lead to:

- compromised structural integrity, or
- compromised structural integrity of elements supported by foundations, which could lead to the failure of environmental separation elements, which could lead to the deterioration of building elements.

For floors and walls or beams supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F21-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of differential vertical movement of soil beneath and between the foundations of dwelling units and the foundations of structurally-attached garages or carports, which could lead to damage to foundations.

This is to limit the probability of an inability to support vertical building loads or lateral earth loads, which could lead to:

- compromised structural integrity, or
- compromised structural integrity of elements supported by foundations, which could lead to the failure of environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection and vibration, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.35.3.2.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F21-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that frost-related soil movement beneath the adjacent slabs-on-ground will be transmitted, which could lead to excessive stresses, which could lead to the cracking of slabs-on-ground supporting attached buildings, which could lead to an inability to support vertical building loads.

This is to limit the probability of:

- structural failure, or
- compromised structural integrity of elements supported by the slab, which could lead to the failure of environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that frost-related soil movement beneath the adjacent slabs-on-ground will be transmitted, which could lead to excessive stresses, which could lead to the cracking of slabs-on-ground supporting attached buildings, which could lead to an inability to support vertical building loads.

This is to limit the probability of:

- pollutant ingress from the exterior, including soil gas, combustion products from parking garages, or particulates,
- compromised thermal performance of components intended to provide resistance to heat transfer,
- condensation,
- precipitation ingress, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or water accumulation, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.35.3.2.(3)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Article 9.12.2.2., which contains requirements regarding the minimum depth of foundations.

---

### **Provision: 9.35.3.3.(1)**

#### **Intent(s)**

*Intent 1.* To clarify that certain small buildings of wood-frame construction do not need foundations.

---

### **Provision: 9.35.3.4.(1)**

#### **Objective**

OS2

#### **Attributions**

[F80-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate clearance above ground level of moisture-vulnerable columns, which could lead to repeated exposure to water from rain runoff or melting snow, which could lead to the deterioration of columns, which could lead to structural failure, which could lead to harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F80-OP2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate clearance above ground level of moisture-vulnerable columns, which could lead to repeated exposure to water from rain runoff or melting snow, which could lead to the deterioration of columns, which could lead to structural failure, which could lead to damage to the building.

**Provision: 9.35.3.4.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.2]

**Intent(s)**

*Intent 1.* To limit the probability of eccentric loading or an inadequate bearing area, which could lead to structural failure, which could lead to harm to persons.

*Intent 2.* To limit the probability of an inadequate bearing area at the bottom of piers, which could lead to compressive failure of the soil, which could lead to the structural failure of columns, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate bearing area at the bottom of piers, which could lead to compressive failure of the soil, which could lead to the structural failure of columns, which could lead to damage to the building.

*Intent 2.* To limit the probability of eccentric loading or an inadequate bearing area, which could lead to structural failure, which could lead to damage to the building.

---

**Provision: 9.35.4.1.(1)**

---

**Intent(s)**

*Intent 1.* To clarify that, due to the fact that garages and carports are usually unoccupied, interior finish for aesthetic reasons is not necessary.

---

**Provision: 9.35.4.2.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate size, which could lead to inadequate strength, which could lead to an inability to resist loads transmitted through supported members, which could lead to the structural failure of columns, which could lead to harm to persons.

*Intent 2.* To direct Code users to Section 9.17., which contains requirements regarding columns.

---
