*Intent 1.* To limit the probability that combustible construction will increase fire severity, which could lead to the spread of a fire to other parts of the building, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

6.2.12.3.(1)(a) [F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that sparks or heat generated by the ventilation system will ignite vapours, particles or deposits, which could lead to a fire or explosion, which could lead to harm to persons.

---

## **Provision: 6.2.12.4.(1)**

---

### **Objective**

OS1

### **Attributions**

6.2.12.4.(1)(a) [F02-OS1.2] Applies to portion of Code text: "... be constructed of *noncombustible* materials ..."

### **Intent(s)**

*Intent 1.* To limit the probability that combustible construction will increase fire severity, which could lead to the spread of fire to other parts of the building, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

6.2.12.4.(1)(b) [F02-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that combustible or reactive deposits will accumulate, which could lead to an increase in the combustible content and fire severity, which could lead to the spread of a fire in the laboratory to other parts of the building, which could lead to damage to the building.

---

### **Objective**

OP1

### **Attributions**

6.2.12.4.(1)(a) [F02-OP1.2] Applies to portion of Code text: "... be constructed of *noncombustible* materials ..."

### **Intent(s)**

*Intent 1.* To limit the probability that combustible construction will increase fire severity, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

---

**Objective**

OS3

**Attributions**

6.2.12.4.(1)(a) [F80-OS3.4] Applies to portion of Code text: "... be constructed of ... materials ... chemically resistant to the *dangerous goods* vapours and particles being exhausted ..."

**Intent(s)**

*Intent 1.* To limit the probability that the ventilation system will prematurely deteriorate or fail, which could lead to the escape of hazardous vapours or particles, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

6.2.12.4.(1)(b) [F02-OS1.2] [F82-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that combustible or reactive deposits will accumulate, which could lead to an increase in the combustible content and fire severity, which could lead to the spread of a fire in the laboratory to other parts of the building, which could lead to harm to persons.

*Intent 2.* To limit the probability that combustible or reactive deposits will accumulate, which could lead to obstruction of the ventilation system and reduction of its exhaust capacity, which could lead to an explosive atmosphere, which in the presence of a source of ignition could lead to a fire or explosion, which could lead to harm to persons.

*Intent 3.* To limit the probability that combustible or reactive deposits will accumulate on the blades of the exhaust fan, which could lead to its misalignment or improper operation, which could lead to the generation of sparks or heat and the ignition of deposits or explosive vapours or mists, which could lead to a fire or explosion, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

6.2.12.4.(1)(a) [F80-OS1.1] Applies to portion of Code text: "... be constructed of ... materials ... chemically resistant to the *dangerous goods* vapours and particles being exhausted ..."

**Intent(s)**

*Intent 1.* To limit the probability that the ventilation system will prematurely deteriorate or fail, which could lead to the escape of vapours or particles in areas where they can be ignited, which could lead to a fire or explosion, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

6.2.12.4.(1)(a) [F01-OS1.1] Applies to portion of Code text: "... be constructed of ... materials compatible with ... the *dangerous goods* vapours and particles being exhausted ..."

**Intent(s)**

*Intent 1.* To limit the probability that vapours or particles being exhausted will undergo an undesirable reaction with enclosure and duct construction material, which could lead to a fire or explosion, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 6.2.12.4.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt combustible materials from the application of Clause 6.2.12.4.(1)(a) and permit their usage if:

- noncombustible materials cannot be used because of their incompatibility, deterioration or dangerous reaction with the dangerous goods, and
- combustible materials [limited combustibility] will not contribute significantly to the spread of fire.

### **Provision: 6.2.12.4.(3)**

---

#### **Objective**

OS1

#### **Attributions**

[F02-OS1.2]

#### **Intent(s)**

*Intent 1.* To override the requirement for a flame-spread rating of not more than 25 in Clause 6.2.12.4.(2)(b) and to permit a higher flame-spread rating if an automatic fire suppression system is provided.

This is to limit the probability that a fire in the power-ventilated enclosure and exhaust duct system will spread to other parts of the building, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F02-OP1.2]

#### **Intent(s)**

*Intent 1.* To override the requirement for a flame-spread rating of not more than 25 in Clause 6.2.12.4.(2)(b) and to permit a higher flame-spread rating if an automatic fire suppression system is provided.

This is to limit the probability that a fire in the power-ventilated enclosure and exhaust duct system will spread to other parts of the building, which could lead to damage to the building.

### **Provision: 6.3.1.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Article 6.2.1.4., which lists appliance installation standards.

### **Provision: 6.3.1.2.(1)**

---

#### **Intent(s)**

*Intent 1.* To modify the application of Section 9.21. to apply to rectangular concrete or masonry chimneys in situations where Part 6 would otherwise apply.

*Intent 2.* To exempt certain chimneys from the application of Sentence 6.2.1.4.(1) as referred to in Sentence 6.3.1.1.(1).

**Provision: 6.3.1.2.(2)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of chimneys will fall significantly below expectations, which could lead to radiant heat loss, which could lead to failure, which could lead to the ignition of combustible building elements, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of chimneys will fall significantly below expectations, which could lead to radiant heat loss, which could lead to failure, which could lead to the ignition of combustible building elements, which could lead to damage to the building.

**Provision: 6.3.1.3.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of single-wall metal smoke stacks will fall significantly below expectations, which could lead to the spread of fire from a chimney to other parts of the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of single-wall metal smoke stacks will fall significantly below expectations, which could lead to the spread of fire from a chimney to other parts of the building, which could lead to damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 6.3.1.4.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01, F81-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the inappropriate design or installation of lightning protection systems will lead to inadequate protection, which could lead to fire, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F01, F81-OP1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the inappropriate design or installation of lightning protection systems will lead to inadequate protection, which could lead to fire, which could lead to damage to the building.

### **Provision: 6.3.1.5.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F20, F80-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that:

- inappropriate materials for ladders will lead to:
  - inadequate strength to support expected loads, or
  - an inability to resist exposure to the environment, which could lead to corrosion, or
- the inappropriate construction of ladders will lead to inadequate strength to support expected loads.

This is to limit the probability of failure of ladders when in use, which could lead to harm to persons.

### **Provision: 6.3.1.5.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that ladders will be used by unauthorized persons, which could lead to falls, which could lead to harm to persons.

**Provision: 7.1.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 1.3.3. where the application of Part 7 is stated.

**Provision: 7.1.1.2.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Part 7.

**Provision: 7.1.2.1.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F31-OS3.2] [F43-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that plumbing systems will not meet appropriate design and installation standards, which could lead to unsafe conditions, which could lead to harm to persons.

---

**Objective**

OH2

**Attributions**

[F70-OH2.2] [F72-OH2.1]

**Intent(s)**

*Intent 1.* To limit the probability that plumbing systems will not meet appropriate design and installation standards, which could lead to unsanitary conditions, which could lead to harm to persons.

**Provision: 7.1.3.1.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 3.7.2. and Article 3.8.2.3. to all buildings [as opposed to only buildings to which Part 3 applies].

**Provision: 7.1.3.2.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Section 9.31. to all dwelling units [as opposed to only buildings to which Part 9 applies].

**Provision: 7.1.4.1.(1)**

---

**Intent(s)**

*Intent 1.* To state that italicized words are defined in Article 1.4.1.2.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 8.1.1.1.(1)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 1.3.3. where the application of Part 8 is stated.

---

### **Provision: 8.1.1.1.(2)**

#### **Intent(s)**

*Intent 1.* To state the application of Part 8.

---

### **Provision: 8.1.1.1.(3)**

#### **Intent(s)**

*Intent 1.* To direct Code users to the NFC for requirements regarding fire safety at construction and demolition sites.

---

### **Provision: 8.1.1.2.(1)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Article 1.4.1.2. where italicized terms are defined.

---

### **Provision: 8.1.1.3.(1)**

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that demolition activities will lead to a fire or explosion, which could lead to harm to persons.

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 5.6. of the NFC

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.1, OS5.3, OS5.8] [F34-OS5.5] [F31, F32, F43, F44-OS5.6]

#### **Intent(s)**

*Intent 1.* To limit the probability that demolition activities will lead to unsafe conditions, which could lead to harm to persons.

---

### **Provision: 8.1.2.1.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Part 8 and make it applicable to the building site [as opposed to just the building itself].

**Provision: 8.1.2.2.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that construction, alteration or demolition activities will lead to a fire or explosion, which could lead to harm to persons.

**Objective**

OS5

**Attributions**

[F30-OS5.1, OS5.3, OS5.8] [F34-OS5.5] [F31, F32, F43, F44-OS5.6]

**Intent(s)**

*Intent 1.* To limit the probability that construction, alteration or demolition activities will lead to unsafe conditions, which could lead to harm to persons.

**Provision: 8.2.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Article 8.2.1.2.

**Attributions**

8.2.1.1.(1)(a), 8.2.1.1.(1)(b), 8.2.1.1.(1)(c)

**Intent(s)**

*Intent 1.* To waive the need for a covered way to protect the public if certain conditions are met:

- the work is undertaken within a solid enclosure so that persons are not exposed to a hazard, or
- the work is sufficiently set back from a public way to minimize the hazard to persons using the public way.

**Provision: 8.2.1.2.(1)**

---

**Objective**

OS5

**Attributions**

8.2.1.2.(1)(a), 8.2.1.2.(1)(b), 8.2.1.2.(1)(d), 8.2.1.2.(1)(e), 8.2.1.2.(1)(f), 8.2.1.2.(1)(g) [F30-OS5.1, OS5.2] [F34-OS5.5]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that gaps in the portion of the covered way adjacent to the site will allow persons to inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

*Intent 2.* To limit the probability that gaps in the portion of the covered way adjacent to the site will allow items arising from activities on the site to be projected onto the covered way, which could lead to harm to persons.

*Intent 3.* To limit the probability that insufficient width or height of covered ways, the absence of illumination, or contact with rough surfaces of the structure will lead to persons bumping into objects or other persons, which could lead to harm to persons.

*Intent 4.* To limit the probability that the lack of a railing on the street side of a covered way will allow persons to move away from the safety of the covered way into a traffic area, which could lead to harm to persons.

*Intent 5.* To limit the probability that construction materials or debris falling onto the roof of the covered way will slide or bounce onto the street, which could lead to persons and vehicles passing beside the construction site being exposed to hazards, which could lead to harm to persons.

---

### **Objective**

OS5

### **Attributions**

8.2.1.2.(1)(c) [F20-OS5.7]

### **Intent(s)**

*Intent 1.* To limit the probability that normal loads on the covered way, as well as loads arising from construction or demolition activities, will cause the structural failure of the covered way, which could lead to harm to persons.

---

### **Provision: 8.2.1.3.(1)**

---

### **Objective**

OS5

### **Attributions**

[F30-OS5.1, OS5.3, OS5.6] [F34-OS5.5]

### **Intent(s)**

*Intent 1.* To limit the probability that persons using a public way or passing by will be exposed to hazards associated with construction or demolition activities, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons will inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

---

### **Provision: 8.2.1.3.(2)**

---

### **Objective**

OS5

### **Attributions**

[F34-OS5.5] [F30-OS5.3]

### **Intent(s)**

*Intent 1.* To limit the probability that persons will inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons will be injured from contact with rough surfaces of the barricade, which could lead to harm to persons.

**Provision: 8.2.1.3.(3)**

---

**Objective**

OS5

**Attributions**

[F34-OS5.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons will inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

**Provision: 8.2.1.4.(1)**

---

**Objective**

OS5

**Attributions**

[F34-OS5.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons will inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

**Provision: 8.2.1.5.(1)**

---

**Objective**

OS5

**Attributions**

[F34-OS5.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons will inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

**Provision: 8.2.2.1.(1)**

---

**Objective**

OS5

**Attributions**

[F60-OS5.8]

**Intent(s)**

*Intent 1.* To limit the probability that water will cause the failure of the sides of the excavation, which could lead to the ground surrounding the excavation collapsing into the excavation, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS5

### **Attributions**

[F60-OS5.4]

### **Intent(s)**

*Intent 1.* To limit the probability that persons who might enter or fall into the excavation will be drowned or injured from the intake of water, which could lead to harm to persons.

---

### **Provision: 8.2.2.2.(1)**

---

### **Objective**

OP4

### **Attributions**

8.2.2.2.(1)(a) [F21-OP4.1]

### **Intent(s)**

*Intent 1.* To limit the probability that excavation operations will lead to damage to adjacent buildings.

---

### **Objective**

OS5

### **Attributions**

8.2.2.2.(1)(b) [F21-OS5.8]

### **Intent(s)**

*Intent 1.* To limit the probability that excavation operations will lead to the failure of any part of adjoining buildings, which could lead to harm to persons.

---

### **Provision: 8.2.3.1.(1)**

---

### **Objective**

OS5

### **Attributions**

[F30-OS5.1, OS5.3, OS5.2]

### **Intent(s)**

*Intent 1.* To limit the probability that persons or passing vehicles will be negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

---

### **Provision: 8.2.3.1.(2)**

---

### **Objective**

OS5

### **Attributions**

[F30-OS5.3, OS5.2]

### **Intent(s)**

*Intent 1.* To limit the probability that persons or vehicles will trip over or hit materials or equipment, which could lead to harm to persons.

---

**Provision: 8.2.3.1.(3)**

**Objective**

OS5

**Attributions**

[F30-OS5.3, OS5.2]

**Intent(s)**

*Intent 1.* To limit the probability that persons will trip over or hit materials or equipment, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons will be obstructed in their path of travel [along the sidewalk], which could lead to persons using the street for passage, which could lead to persons being impacted by vehicles, which could lead to harm to persons.

---

**Provision: 8.2.3.1.(4)**

**Objective**

OS5

**Attributions**

[F30-OS5.3, OS5.2]

**Intent(s)**

*Intent 1.* To exempt obstructed sidewalks from the application of Sentence 8.2.3.1.(3), which would otherwise require their clearance of obstructions, if certain measures are taken [provision of an unobstructed temporary sidewalk]. This is to limit the probability that persons will:

- trip over or hit materials or equipment, which could lead to harm to persons, or
- be obstructed in their path of travel [along the sidewalk], which could lead to persons using the street for passage, which could lead to persons being impacted by vehicles, which could lead to harm to persons.

---

**Provision: 8.2.3.2.(1)**

**Objective**

OS5

**Attributions**

[F30-OS5.1]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 8.2.3.1.(1), which would otherwise require provisions for safe passage, if certain measures are taken [closure of the street or public way]. This is to limit the probability that passing pedestrians will be negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 8.2.3.3.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.1, OS5.3, OS5.2] [F34-OS5.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will inadvertently wander onto the site, which could lead to persons being exposed to unsafe conditions, which could lead to harm to persons.

*Intent 2.* To limit the probability that passing persons or vehicles will be negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

### **Provision: 8.2.3.4.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that damaged sidewalks, streets or other public property will be left unrepaired, which could lead to unsafe conditions [e.g. sidewalk tripping hazards, street potholes] which could lead to harm to persons.

### **Provision: 8.2.3.4.(2)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.3, OS5.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will hit or trip over an obstruction, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons will be obstructed in their path of travel [along the sidewalk], which could lead to persons using the street for passage, which could lead to persons being impacted by vehicles, which could lead to harm to persons.

*Intent 3.* To limit the probability that vehicles will hit materials or equipment, which could lead to harm to persons.

### **Provision: 8.2.3.5.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.3, OS5.2]

**Intent(s)**

*Intent 1.* To limit the probability that persons will hit or trip over an obstruction, which could lead to harm to persons.

*Intent 2.* To limit the probability that vehicles will hit materials or equipment, which could lead to harm to persons.

**Provision: 8.2.4.1.(1)**

---

**Objective**

OS5

**Attributions**

[F30-OS5.2]

**Intent(s)**

*Intent 1.* To limit the probability that passing vehicles will be negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

**Provision: 8.2.4.2.(1)**

---

**Objective**

OS5

**Attributions**

[F30-OS5.2]

**Intent(s)**

*Intent 1.* To limit the probability that flags will not be visible or readily recognized, which could lead to passing vehicles being negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

**Provision: 8.2.4.3.(1)**

---

**Objective**

OS5

**Attributions**

[F30-OS5.2]

**Intent(s)**

*Intent 1.* To limit the probability that signs will not be visible or readily recognized, which could lead to passing vehicles being negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

**Provision: 8.2.4.4.(1)**

---

**Objective**

OS5

**Attributions**

[F30-OS5.2]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that:

- ambiguous directions will be given by workers directing traffic, and
- workers will not be readily seen by motorists, which could lead to the inability of motorists to recognize directions given by workers.

This is to limit the probability that passing vehicles will be negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

---

### **Provision: 8.2.4.5.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that workers will not be readily seen by motorists, which could lead to the inability of motorists to recognize directions given by workers.

This is to limit the probability that passing vehicles will be negatively affected by the site operations [e.g. run into materials or equipment, or be hit by moving equipment], which could lead to harm to persons.

---

### **Provision: 8.2.5.1.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that waste or other material will fall onto persons in the vicinity of the site, which could lead to harm to persons.

---

### **Provision: 8.2.5.2.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.1, OS5.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that waste material will be allowed to build up, which could lead to unsafe conditions [falling debris, tripping hazard] in the vicinity of the site, which could lead to harm to persons.

---

### **Provision: 8.2.5.3.(1)**

---

#### **Objective**

OS5

#### **Attributions**

[F30-OS5.1, OS5.3] [F34-OS5.6]

**Intent(s)**

*Intent 1.* To limit the probability that persons in the vicinity of the site will hit or trip over waste material, which could lead to harm to persons.

*Intent 2.* To limit the probability that waste or other material will fall onto persons in the vicinity of the site, which could lead to harm to persons.

*Intent 3.* To limit the probability that unauthorized persons will gain access to the waste material, which could lead to unsafe conditions [e.g. persons tripping on the waste, cutting themselves on sharp objects], which could lead to harm to persons.

**Provision: 8.2.5.4.(1)**

---

**Objective**

OS5

**Attributions**

[F30-OS5.1]

**Intent(s)**

*Intent 1.* To limit the probability that waste material will not be controlled or confined to the chute during disposal operations, which could lead to the waste material falling outside the chute, which could lead to waste material falling onto persons in the vicinity of the site, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.1.1.1.(1)**

#### **Intent(s)**

*Intent 1.* To direct Code users to a Section of the Code that contains a detailed statement of application for Part 9.

---

### **Provision: 9.1.2.1.(1)**

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that too large a floor area in secondary suites [i.e. more than 80 m<sup>2</sup>] will increase the occupant load or fire load beyond the loads generally found in a single dwelling unit with a finished basement, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F05-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that too large a floor area in secondary suites [i.e. more than 80 m<sup>2</sup>] will increase the occupant load or fire load beyond the loads generally found in a single dwelling unit with a finished basement, which could lead to fire emergency response operations being delayed or ineffective, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.2.1.1.(1)**

#### **Intent(s)**

*Intent 1.* To direct Code users to the definitions provided in Article 1.4.1.2.

---

### **Provision: 9.3.1.1.(1)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20, F21, F80-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F21-OP2.3, OP2.4]

[F20, F80-OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- where concrete supports walls or floors, an inability to resist expected loads, which could lead to
  - excessive deformation or deflection of walls, or
  - excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, and
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F21, F80-OH1.1] Applies where concrete supports or is used in the walls of *chimneys* or fireplaces.

[F20, F21, F55, F61, F80-OH1.1, OH1.2] [F20, F21, F61, F80-OH1.3] Applies where concrete supports or is used in an environmental separator.

**Intent(s)**

*Intent 1.* Where concrete supports or is used in the walls of chimneys or fireplaces, to limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads, which could lead to the failure of these walls.

This is to limit the probability of the leakage of combustion products, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* Where concrete supports or is used in an environmental separator, to limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of:

- the compromised integrity of the environmental separator, or

---

## **Intent Statements: NBC 2010**

- an inadequate resistance to air and moisture transfer through the concrete.

This is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation,
- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F21, F80-OH4] Applies where concrete elements support wood-frame floors.

### **Intent(s)**

*Intent 1.* To limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of the excessive deformation of concrete, which could lead to:

- compromised structural integrity, or
- where concrete elements support an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

Where concrete elements support wood-frame floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F21, F80-OS3.1, OS3.7] Applies to concrete floors or steps, concrete that supports wood-frame floors or steps, and concrete steps that support *guards* or handrails.

[F20, F21, F80-OS3.4] Applies where concrete supports or is used in *chimneys* or fireplaces.

### **Intent(s)**

**Intent 1.** To limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of:

- compromised structural integrity, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- uneven concrete floor or step surfaces, which could lead to persons tripping,
- the failure of supported handrails or guards, which could lead to persons falling,
- the excessive deflection or vibration of supported wood-frame floors, which could lead to persons losing their balance, tripping or falling, and
- the failure of fireplaces or chimneys, which could lead to the leakage of combustion products, including carbon monoxide gas, into living space, which could lead to the asphyxiation or acute poisoning of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F21, F80-OS1.1] Applies where concrete supports or is used in *chimneys* or fireplaces.

**Intent(s)**

**Intent 1.** To limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

Where concrete supports or is used in chimneys or fireplaces, this is to limit the probability of the compromised integrity of the chimney or fireplace, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

---

**Provision: 9.3.1.1.(2)**

**Intent(s)**

**Intent 1.** To state the application of Article 9.3.1.2. to 9.3.1.9.

**Intent 2.** To exempt site-batched concrete from compliance with CAN/CSA-A438 as required by Sentence 9.3.1.1.(1) for cast-in-place concrete.

---

**Provision: 9.3.1.1.(3)**

**Intent(s)**

**Intent 1.** To expand the application of Part 4 to reinforced concrete.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.3.1.1.(4)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F80-OS2.3]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of the use of:

- inappropriate or substandard concrete,
- inappropriate or substandard reinforcing, or
- insufficient overlap of reinforcing bars.

This is to limit the probability of the inadequate performance or premature failure of flat insulating concrete form walls under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.4]

[F21, F80-OP2.3, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of the use of:

- inappropriate or substandard concrete,
- inappropriate or substandard reinforcing, or
- insufficient overlap of reinforcing bars.

This is to limit the probability of inadequate performance or premature failure of flat insulating concrete form walls under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- where concrete supports walls or floors, an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, and
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,

- compromised operation of windows and doors, and
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F21, F80-OH1.1] Applies where concrete supports or is used in the walls of *chimneys* or fireplaces.

[F20, F21, F80, F61, F55-OH1.1, OH1.2] [F20, F21, F80, F61-OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* Where concrete supports or is used in the walls of chimneys or fireplaces, to limit the probability of the use of:

- inappropriate or substandard concrete,
- inappropriate or substandard reinforcing, or
- insufficient overlap of reinforcing bars.

This is to limit the probability of the inadequate performance or premature failure of flat insulating concrete form walls under expected environmental or structural loads, which could lead to the failure of these walls.

This is to limit the probability of the leakage of combustion products, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons.

*Intent 2.* Where concrete supports or is used in an environmental separator, to limit the probability of the use of:

- inappropriate or substandard concrete,
- inappropriate or substandard reinforcing, or
- insufficient overlap of reinforcing bars.

This is to limit the probability of the inadequate performance or premature failure of flat insulating concrete form walls under expected environmental or structural loads.

This is to limit the probability of:

- the compromised integrity of the environmental separator, or
- an inadequate resistance to air and moisture transfer through the concrete.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

**Intent 1.** To limit the probability that the use of inappropriate aggregate materials or the presence of an excessive proportion of contaminants in aggregates will lead to the premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to:
  - excessive deformation or deflection of walls, and
  - excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, and
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F80, F61, F55-OH1.1, OH1.2] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

[F20, F80, F61-OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

### **Intent(s)**

**Intent 1.** To limit the probability that the use of inappropriate aggregate materials or the presence of an excessive proportion of contaminants in aggregates will lead to the premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of:

- where concrete supports or is used in an environmental separator
  - the compromised integrity of the environmental separator, or
  - an inadequate resistance to air and moisture transfer through the concrete, and
- where concrete supports or is used in the walls of chimneys or fireplaces, failure of these walls.

This is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation,
- the ingress of moisture from the ground,
- the leakage of combustion products, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,

- deterioration, which could lead to further compromised integrity of environmental separators, or
- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20, F80-OS1.1] Applies to concrete used in *chimneys* or fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability that the use of inappropriate aggregate materials or the presence of an excessive proportion of contaminants in aggregates will lead to the premature failure of concrete under expected environmental or structural loads.

Where concrete supports or is used in chimneys or fireplaces, this is to limit the probability of the compromised integrity of the chimney or fireplace, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F20, F80-OS3.1] Applies to floors and elements that support floors.

[F20, F80-OS3.4] Applies to concrete used in *chimneys* or fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability that the use of inappropriate aggregate materials or the presence of an excessive proportion of contaminants in aggregates will lead to the premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of:

- compromised structural integrity, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- uneven concrete floor surfaces, which could lead to tripping,
- excessive deflection or vibration of supported wood-frame floors, which could lead to a loss of balance, tripping or falling, and
- failure of fireplaces or chimneys, which could lead to the leakage of combustion products, including carbon monoxide gas, into living space, which could lead to the asphyxiation or acute poisoning of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH4

### **Attributions**

[F20, F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that the use of inappropriate aggregate materials or the presence of an excessive proportion of contaminants in aggregates will lead to the premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of the excessive deformation of concrete, which could lead to:

- compromised structural integrity, or
- where concrete elements support an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

Where concrete elements support wood-frame floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Provision: 9.3.1.5.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F80-OS2.3]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that water containing an excessive proportion of contaminants will lead to the inadequate strength or accelerated deterioration of concrete under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F80-OP2.3, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that water containing an excessive proportion of contaminants will lead to the inadequate strength or accelerated deterioration of concrete under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- where concrete supports walls or floors, an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, and
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F80, F61, F55-OH1.1, OH1.2] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

[F20, F80, F61-OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

### **Intent(s)**

**Intent 1.** To limit the probability that water containing an excessive proportion of contaminants will lead to the inadequate strength or accelerated deterioration of concrete under expected environmental or structural loads.

Where concrete supports or is used in the walls of chimneys or fireplaces, to limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads, which could lead to the failure of these walls.

This is to limit the probability of the leakage of combustion products, which could lead to negative effects on the air quality of indoor spaces.

This is to limit the probability of harm to persons

**Intent 2.** Where concrete supports or is used in an environmental separator, to limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of:

- the compromised integrity of the environmental separator, or
- an inadequate resistance to air and moisture transfer through the concrete.

This is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation,
- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F80-OH4] Applies where concrete elements support wood-frame floors.

### **Intent(s)**

*Intent 1.* To limit the probability that water containing an excessive proportion of contaminants will lead to the inadequate strength or accelerated deterioration of concrete under expected environmental or structural loads.

This is to limit the probability of the excessive deformation of concrete, which could lead to:

- compromised structural integrity, or
- where concrete elements support an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

Where concrete elements support wood-frame floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F80-OS3.1] Applies to concrete floors or steps, concrete that supports wood-frame floors or steps, and concrete steps that support *guards* or handrails.

[F20, F80-OS3.4, OS3.7] Applies where concrete supports or is used in *chimneys* or fireplaces.

### **Intent(s)**

*Intent 1.* To limit the probability that water containing an excessive proportion of contaminants will lead to the inadequate strength or accelerated deterioration of concrete under expected environmental or structural loads.

This is to limit the probability of:

- compromised structural integrity, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- uneven concrete floor or step surfaces, which could lead to persons tripping,

- the failure of supported handrails or guards, which could lead to persons falling,
- the excessive deflection or vibration of supported wood-frame floors, which could lead to persons losing their balance, tripping or falling, and
- the failure of fireplaces or chimneys, which could lead to the leakage of combustion products, including carbon monoxide gas, into living space, which could lead to the asphyxiation or acute poisoning of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F80-OS1.1] Applies where concrete supports or is used in *chimneys* or fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability that water containing an excessive proportion of contaminants will lead to the inadequate strength or accelerated deterioration of concrete under expected environmental or structural loads.

Where concrete supports or is used in chimneys or fireplaces, this is to limit the probability of the compromised integrity of the chimney or fireplace, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

9.3.1.7.(1)(a) [F20, F21, F61-OH4] Applies to elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inappropriate cement/aggregate ratio, or
- excessive water in concrete.

This is to limit the probability of:

- aggregate segregation,
- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer for foundation walls and basement floors, de-icing salts, water absorption or freeze-thaw stresses.

This is to limit the probability of the excessive deformation of concrete, which could lead to:

- compromised structural integrity, or
- where concrete elements support an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

Where concrete elements support wood-frame floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

9.3.1.7.(1)(a) [F20, F21, F61-OS3.1] Applies to concrete floors or steps, concrete that supports wood-frame floors or steps, and concrete steps that support *guards* or handrails.

9.3.1.7.(1)(a) [F20, F21, F61-OS3.4, OS3.7] Applies where concrete supports or is used in *chimneys* or fire-places.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an inappropriate cement/aggregate ratio, or
- excessive water in concrete.

This is to limit the probability of:

- aggregate segregation,
- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer for foundation walls and basement floors, de-icing salts, water absorption or freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- uneven concrete floor or step surfaces, which could lead to persons tripping,
- the failure of supported handrails or guards, which could lead to persons falling,
- the excessive deflection or vibration of supported wood-frame floors, which could lead to persons losing their balance, tripping or falling, and
- the failure of fireplaces or chimneys, which could lead to the leakage of combustion products, including carbon monoxide gas, into living space, which could lead to the asphyxiation or acute poisoning of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

9.3.1.7.(1)(a) [F20, F21, F61-OS1.1] Applies where concrete supports or is used in *chimneys* or fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inappropriate cement/aggregate ratio, or
- excessive water in concrete.

This is to limit the probability of:

- aggregate segregation,
- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer for foundation walls and basement floors.

Where concrete supports or is used in chimneys or fireplaces, this is to limit the probability of the compromised integrity of the chimney or fireplace, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

9.3.1.7.(1)(b) [F20-OS2.3] Applies where concrete is used in an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- an inappropriate cement/aggregate ratio, or
- excessive water in concrete.

This is to limit the probability of:

- aggregate segregation,
- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer.

This is to limit the probability of compromised structural integrity, which could lead to:

---

## **Intent Statements: NBC 2010**

- structural failure, or
- where concrete is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

*Intent 1.* To limit the probability of:

- an inappropriate cement/aggregate ratio, or
- excessive water in concrete.

This is to limit the probability of:

- aggregate segregation,
- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer.

Where concrete is used in an environmental separator, this is to limit the probability of:

- the compromised integrity of the environmental separator, or
- an inadequate resistance to air and moisture transfer through the concrete.

This is to limit the probability of:

- pollutant ingress (from the exterior, including soil gas)
- condensation,
- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

- premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- where concrete supports walls or floors, an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, and
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F21, F61, F55-OH1.1] Applies where concrete supports or is used in the walls of *chimneys* or fireplaces.

[F20, F21-OH1.2, OH1.3] Applies where concrete supports or is used in an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the concrete will not flow around the aggregate in the typically thin wall and slab sections used in Part 9 buildings, which could lead to aggregate segregation, which could lead to:

- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer.

This is to limit the probability of:

- spalling,
- inadequate performance, or
- premature failure of concrete under expected environmental or structural loads.

Where concrete supports or is used in the walls of chimneys or fireplaces, to limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads, which could lead to the failure of these walls.

This is to limit the probability of the leakage of combustion products, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To limit the probability that the concrete will not flow around the aggregate in the typically thin wall and slab sections used in Part 9 buildings, which could lead to aggregate segregation, which could lead to:

- reduced compressive strength,
- increased shrinkage and cracking, or
- low resistance to air and moisture transfer.

This is to limit the probability of:

- spalling,
- inadequate performance, or
- premature failure of concrete under expected environmental or structural loads.

Where concrete supports or is used in an environmental separator, to limit the probability of the inadequate performance or premature failure of concrete under expected environmental or structural loads.

This is to limit the probability of:

- the compromised integrity of the environmental separator, or
- an inadequate resistance to air and moisture transfer through the concrete.

This is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation,
- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,

*Intent 1.* To limit the probability of:

- interruption of the hydration process,
- freezing and expansion of internal water, and
- over-watering due to the melting of ice.

This is to limit the probability of the failure of internal bonds in the concrete, which could lead to reduced compressive strength, which could lead to an inadequate resistance to:

- expected environmental or structural loads, or
- air and moisture transfer.

This is to limit the probability of:

- where concrete supports or is used in an environmental separator
  - the compromised integrity of the environmental separator, or
  - an inadequate resistance to air and moisture transfer through the concrete, and
- where concrete supports or is used in the walls of chimneys or fireplaces, failure of these walls.

This is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation,
- the ingress of moisture from the ground,
- the leakage of combustion products, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20, F61, F55-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- interruption of the hydration process,
- freezing and expansion of internal water, and
- over-watering due to the melting of ice.

This is to limit the probability of the failure of internal bonds in the concrete, which could lead to reduced compressive strength, which could lead to an inadequate resistance to:

- expected environmental or structural loads, or
- air and moisture transfer.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20, F61, F55-OP2.3] [F61, F55-OP2.4] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- interruption of the hydration process,
- freezing and expansion of internal water, and
- over-watering due to the melting of ice.

This is to limit the probability of the failure of internal bonds in the concrete, which could lead to reduced compressive strength, which could lead to an inadequate resistance to:

- expected environmental or structural loads, or
- air and moisture transfer.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to
  - excessive deformation or deflection of walls, and
  - excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, and
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.1] Applies to concrete that supports or is used in *chimneys* or fireplaces.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- interruption of the hydration process,
- freezing and expansion of internal water, and
- over-watering due to the melting of ice.

This is to limit the probability of the failure of internal bonds in the concrete, which could lead to reduced compressive strength, which could lead to an inadequate resistance to:

- expected environmental or structural loads, or
- air and moisture transfer.

Where concrete supports or is used in chimneys or fireplaces, this is to limit the probability of the compromised integrity of the chimney or fireplace, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F20, F61, F55-OS3.1] Applies to floors and elements that support floors.

[F20, F61, F55-OS3.4] Applies to concrete that supports or is used in *chimneys* or fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability of:

- interruption of the hydration process,
- freezing and expansion of internal water, and
- over-watering due to the melting of ice.

This is to limit the probability of the failure of internal bonds in the concrete, which could lead to reduced compressive strength, which could lead to an inadequate resistance to:

- expected environmental or structural loads, or
- air and moisture transfer.

This is to limit the probability of:

- compromised structural integrity, or
- where concrete supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- uneven concrete floor surfaces, which could lead to tripping,
- excessive deflection or vibration of supported wood-frame floors, which could lead to a loss of balance, tripping or falling, and
- failure of fireplaces or chimneys, which could lead to the leakage of combustion products, including carbon monoxide gas, into living space, which could lead to the asphyxiation or acute poisoning of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F61, F55-OH4] Applies to elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of:

- interruption of the hydration process,
- freezing and expansion of internal water, and
- over-watering due to the melting of ice.

This is to limit the probability of the failure of internal bonds in the concrete, which could lead to reduced compressive strength, which could lead to an inadequate resistance to:

- expected environmental or structural loads, or

---

## **Intent Statements: NBC 2010**

- air and moisture transfer.

This is to limit the probability of the excessive deformation of concrete, which could lead to:

- compromised structural integrity, or
- where concrete elements support an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

Where concrete elements support wood-frame floors, this is to limit the probability of deflection or vibration of such floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Provision: 9.3.2.1.(1)**

#### **Intent(s)**

*Intent 1.* To facilitate determination of compliance with Articles 9.3.2.2., 9.3.2.3., 9.23.4.2. and 9.23.14.11.

---

### **Provision: 9.3.2.2.(1)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate grades of visually graded lumber will be used, which could lead to compromised structural integrity of the visually graded lumber or of elements supported by the visually graded lumber, which could lead to excessive movement, deformation or failure under expected lateral, gravity or wind uplift loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where lumber supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, or elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate grades of visually graded lumber will be used, which could lead to compromised structural integrity of the visually graded lumber or of elements supported by the visually graded lumber, which could lead to excessive movement, deformation or failure under expected lateral, gravity or wind uplift loads.

This is to limit the probability of:

- compromised structural integrity, or
- where lumber supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- a loss of balance, tripping or falling,
- the compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate grades of visually graded lumber will be used, which could lead to compromised structural integrity of the visually graded lumber or of elements supported by the visually graded lumber, which could lead to excessive movement, deformation or failure under expected lateral, gravity or wind uplift loads.

---

## **Intent Statements: NBC 2010**

Where lumber supports or is used in an environmental separator, this is to limit the probability of compromised performance of the building envelope, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate grades of visually graded lumber will be used, which could lead to compromised structural integrity of the visually graded lumber or of elements supported by the visually graded lumber, which could lead to excessive movement, deformation or failure under expected lateral, gravity or wind uplift loads.

Where lumber is used in assemblies that are required to provide fire resistance, this is to limit the probability of the compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate grades of visually graded lumber will be used, which could lead to compromised structural integrity of the visually graded lumber or of elements supported by the visually graded lumber, which could lead to excessive movement, deformation or failure under expected lateral, gravity or wind uplift loads.

This is to limit the probability of:

- compromised structural integrity, or
- where lumber supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deformation of walls, ceilings and roofs, and
- deflection or vibration of floors.

This is to limit the probability of negative effects on the psychological well-being of persons.

---

**Provision: 9.3.2.3.(1)**

**Intent(s)**

*Intent 1.* To expand the application of Subsection 4.3.1. to machine stress rated lumber used in Part 9 buildings.

---

**Provision: 9.3.2.4.(1)**

**Intent(s)**

*Intent 1.* To facilitate determination of compliance with Sentence 9.23.15.2.(1) for subflooring, Sentence 9.23.16.2.(1) for roof sheathing, and Article 9.23.17.2. for wall sheathing.

---

**Provision: 9.3.2.5.(1)**

**Objective**

OS2

**Attributions**

[F21, F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the entrapment of moisture inside closed building envelopes, which could lead to:

- excessive post-installation shrinkage and warping,
- wood decay, which could lead to a loss of lumber strength, or
- the exposure of other materials that are moisture-sensitive and susceptible to decay to high moisture levels and decay fungi.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where lumber supports or is used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of an inadequate resistance to termites or an inability to detect and mitigate termite infestations, which could lead to damage to wood elements, which could lead to an inability to resist expected gravity or lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where structural wood elements support or are used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows and doors, and
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F82, F80, F61, F55-OH1.1, OH1.2] [F82, F80, F61-OH1.3] Applies where structural wood elements support or are used in an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to termites or an inability to detect and mitigate termite infestations, which could lead to damage to wood elements, which could lead to an inability to resist expected gravity or lateral loads.

Where structural wood elements support or are used in an environmental separator, this is to limit the probability of compromised performance of the building envelope, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of indoor air and surface temperatures, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable upon wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F82, F80-OH4] Applies where structural wood elements support or are used in floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to termites or an inability to detect and mitigate termite infestations, which could lead to damage to wood elements, which could lead to an inability to resist expected gravity or lateral loads.

This is to limit the probability of:

- compromised structural integrity, or
- where structural wood elements support or are used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of the deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F82, F80-OS3.1] Applies where structural wood elements support or are used in floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to termites or an inability to detect and mitigate termite infestations, which could lead to damage to wood elements, which could lead to an inability to resist expected gravity or lateral loads.

This is to limit the probability of:

- compromised structural integrity, or
- where structural wood elements support or are used in an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

Where structural wood elements support or are used in floors, this is to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F82, F80-OS1.2] Applies where structural wood elements support or are used in assemblies that are required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to termites or an inability to detect and mitigate termite infestations, which could lead to damage to wood elements, which could lead to an inability to resist expected gravity or lateral loads.

Where structural wood elements support or are used in assemblies that are required to provide fire resistance, this is to limit the probability of the compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.4.1.1.(1)**

**Intent(s)**

*Intent 1.* To state the application of structural requirements in Part 9.

*Intent 2.* To state the application of accepted good engineering practice, where construction does not comply with structural requirements in Part 9.

*Intent 3.* To expand the application of Part 4, where construction does not comply with structural requirements in Part 9.

---

**Provision: 9.4.1.1.(2)**

**Intent(s)**

*Intent 1.* To limit the application of Clause 9.4.1.1.(1)(b) and Clause 9.4.1.1.(1)(c) to cases where the maximum specified live floor load is consistent with the prescriptive solutions for supporting wall framing, fastenings and footings.

---

**Provision: 9.4.1.1.(3)**

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 1.1.3. for requirements regarding climatic and seismic information for building design in Canada.

---

**Provision: 9.4.2.1.(1)**

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.4.2.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.4.2.2.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3] [F22-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that inaccurate snow load assumptions will lead to assemblies being unable to resist gravity, snow and rain loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3] [F22-OP2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that inaccurate snow load assumptions will lead to assemblies being unable to resist gravity, snow and rain loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised integrity, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F22-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that inaccurate snow load assumptions will lead to assemblies being unable to resist gravity, snow and rain loads.

This is to limit the probability of excessive movement, deformation or damage to roofing, which could lead to:

- precipitation ingress, or
- air leakage, which could lead to compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by such separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.4.2.2.(2)**

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability that the design live load for the roof will be less than the anticipated load from maintenance workers and their equipment, which could lead to the collapse of the roof, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

**Intent(s)**

*Intent 1.* To limit the probability that the design live load for the roof will be less than the anticipated load from maintenance workers and their equipment, which could lead to the collapse of the roof, which could lead to damage to the building.

---

**Provision: 9.4.2.2.(3)**

**Intent(s)**

*Intent 1.* To expand the application of Subsection 4.1.6. to include bow string, arch or semi-circular roof trusses that have an unsupported span greater than 6 m.

---

**Provision: 9.4.2.3.(1)**

**Objective**

OS2

**Attributions**

[F20-OS2.1]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate load-carrying capacity, which could lead to an inadequate resistance to gravity loads, which could lead to structural failure, which could lead to structural collapse, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate load-carrying capacity, which could lead to an inadequate resistance to gravity loads, which could lead to compromised structural integrity, which could lead to damage to the building.

---

## **Provision: 9.4.2.4.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate load-carrying capacity, where ceiling joists or truss bottom chords are not specifically designed to carry higher loads, which could lead to an inadequate resistance to gravity loads, which could lead to structural failure, which could lead to structural collapse, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate load-carrying capacity, where ceiling joists or truss bottom chords are not specifically designed to carry higher loads, which could lead to an inadequate resistance to gravity loads, which could lead to compromised structural integrity, which could lead to damage to the building.

---

## **Provision: 9.4.3.1.(1)**

---

### **Objective**

OS2

### **Attributions**

[F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of the excessive deflection of structural members.  
This is to limit the probability of:

- for roof framing, rainwater ingress, and
- for roof framing, ceiling joists or floor framing supporting air barrier materials, vapour barriers or insulation, the displacement or failure of these elements, which could lead to condensation.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of roofs, walls or floors, or of elements supported or protected by roofs, walls and floors, which could lead to structural failure, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F22-OP2.1, OP2.4]

[F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of the excessive deflection of structural members.

This is to limit the probability of:

- compromised integrity of non-structural and structural components of the building, including ceiling membranes,
- for roof framing, rainwater ingress into or through assemblies, which could lead to deterioration, which could lead to compromised structural integrity of roofs or of building elements protected by roofs,
- for roof framing, ceiling joists or floor framing supporting air barrier materials, vapour barriers or insulation, condensation on interior surfaces or within assemblies or condensation of moisture from interior spaces, which could lead to deterioration, which could lead to compromised structural integrity of the roof, ceiling or floor or assemblies supported or protected by these assemblies, and
- excessive springiness or deflection of floor and roof systems,

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH4

**Attributions**

[F22-OH4]

**Intent(s)**

*Intent 1.* To limit the probability that floor and roof systems will be excessively springy, or will become noticeably deformed, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of excessive deflection of structural members.

This is to limit the probability of:

- the excessive deflection or vibration of directly or indirectly supported floors, which could lead to persons losing their balance, tripping or falling; and
- the excessive movement or deformation of directly or indirectly supported walls with windows or doors, which could lead to compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of the excessive deflection of structural members.

Where framing supports or is part of an environmental separator, this is to limit the probability of the excessive deflection, deformation, displacement or failure of required environmental separation elements, which could lead to:

- precipitation ingress,
- air leakage, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by such separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.4.3.1.(2)**

### **Intent(s)**

*Intent 1.* To clarify that only live loads need to be considered in calculating deflections for structural members.

**Provision: 9.4.4.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.2]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that an inadequate design will lead to the overloading of footings, which could lead to excessive subsidence of the soil under the footings, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.2, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that an inadequate design will lead to the overloading of footings, which could lead to excessive subsidence of the soil under the footings, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to footings that support an environmental separator.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that an inadequate design will lead to the overloading of footings, which could lead to excessive subsidence of the soil under the footings, which could lead to the cracking of foundations or building superstructures.

For footings supporting an environmental separator, this is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation, or
- moisture ingress from the ground.

This is to limit the probability of:

- an inadequate control of relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported by foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20-OH4] Applies to footings that support floors and other elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that an inadequate design will lead to the overloading of footings, which could lead to excessive subsidence of the soil under the footings, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1] Applies to footings that support floors and other elements that support floors.

[F20-OS3.7] Applies to footings that support walls that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that an inadequate design will lead to the overloading of footings, which could lead to excessive subsidence of the soil under the footings, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of directly or indirectly supported floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons, or
- the excessive movement or deformation of directly or indirectly supported walls with windows or doors, which could lead to compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

**Provision: 9.4.4.2.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.2]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that an excessive design capacity of foundations will lead to soil subsidence, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.2, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that an excessive design capacity of foundations will lead to soil subsidence, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or

---

## **Intent Statements: NBC 2010**

- an inability to resist expected loads, which could lead to
  - excessive deformation or deflection of walls, or
  - excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

*Intent 1.* To limit the probability that moisture-content-related soil movement, frost heave, pressure due to the formation of ice lenses, adfreeze, and weathering of pyritic material will lead to the cracking of foundations or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of directly or indirectly supported floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons, or
- the excessive movement or deformation of directly or indirectly supported walls with windows or doors, which could lead to compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.4.4.5.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to
  - excessive deformation or deflection of walls, or
  - excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of the cracking of foundations or building superstructures.

This is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation, or

- moisture ingress from the ground.

This is to limit the probability of:

- an inadequate control of relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of the cracking of foundations or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of the cracking of foundations or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or vibration, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.4.4.6.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that using inappropriate design pressures will lead to the walls being unable to resist expected lateral pressure, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

*Intent 2.* To expand the application of Section 4.2. to walls supporting drained earth that are not constructed in accordance with Section 9.15.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1, OP2.3, OP2.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that using inappropriate design pressures will lead to the walls being unable to resist expected lateral pressure, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

*Intent 2.* To expand the application of Section 4.2. to walls supporting drained earth that are not constructed in accordance with Section 9.15.

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

[F20-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that using inappropriate design pressures will lead to the walls being unable to resist expected lateral pressure, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of:

- the excessive deflection or vibration of directly or indirectly supported floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons, or
- the excessive movement or deformation of directly or indirectly supported walls with windows or doors, which could lead to compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

*Intent 2.* To expand the application of Section 4.2. to walls supporting drained earth that are not constructed in accordance with Section 9.15.

---

## **Provision: 9.4.4.6.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that any surcharge on foundation walls will not be included in the design pressures, which could lead to the walls being unable to resist lateral pressure, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

*Intent 2.* To expand the application of Section 4.2. to walls supporting other than drained earth that are not constructed in accordance with Section 9.15.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.3, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability that any surcharge on the foundation walls will not be included in the design pressures, which could lead to the walls being unable to resist lateral pressure, which could lead to the cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

*Intent 2.* To expand the application of Section 4.2. to walls supporting other than drained earth that are not constructed in accordance with Section 9.15.

---

### **Provision: 9.5.1.1.(1)**

#### **Intent(s)**

*Intent 1.* To define the basis for determining the minimum dimensions in this Section.

---

### **Provision: 9.5.1.2.(1)**

#### **Intent(s)**

*Intent 1.* To specify the minimum area of opening required between two rooms or spaces for them to be considered as a combination room.

---

### **Provision: 9.5.1.2.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that all means of egress from dependent bedrooms in combination rooms will be blocked in case of fire, which could lead to persons being trapped in a bedroom, which could lead to harm to persons.

---

### **Provision: 9.5.2.1.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Section 3.8. to include Part 9 buildings.

---

### **Provision: 9.5.2.2.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Article 3.3.1.7. to include Part 9 buildings where the barrier-free path of travel required in Article 9.5.2.1. is provided.

---

### **Provision: 9.5.2.3.(1)**

#### **Intent(s)**

*Intent 1.* To exempt, from the requirement for a barrier-free path of travel stated in Sentence 9.5.2.1.(1), areas of buildings that are not accessible to manual wheelchairs due to a difference in elevation from the entrance and the absence of an elevator.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.5.2.3.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt, from the requirement for a barrier-free path of travel stated in Sentence 9.5.2.1.(1), areas of buildings that are not equipped with an elevator and where there are no dwelling units on the entrance level.

### **Provision: 9.5.3.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an inadequate ceiling height of rooms or spaces [i.e. less than 2.1 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, which could lead to harm to persons.

*Intent 2.* To limit the probability that an inadequate clear height of rooms or spaces [i.e. less than 2.0 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, in areas used infrequently or for a limited time, or where occupants are unfamiliar with the space, which could lead to harm to persons.

*Intent 3.* To limit the probability that an inadequate ceiling height of rooms or spaces [i.e. less than 2.1 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 4.* To limit the probability that an inadequate clear height of rooms or spaces [i.e. less than 2.0 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, in an emergency, in areas used infrequently or for a limited time, or where occupants are unfamiliar with the space, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.5.3.1.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability, where provision of a minimum 2.1 m ceiling height may be cost-prohibitive, that an inadequate ceiling height of rooms or spaces [i.e. less than 1.95 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, which could lead to harm to persons.

*Intent 2.* To limit the probability, where provision of a minimum 2.1 m ceiling height may be cost-prohibitive, that an inadequate ceiling height of rooms or spaces [i.e. less than 1.95 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.5.3.1.(3)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability, where provision of a minimum 2.0 m clear height may be cost-prohibitive, that an inadequate clear height of rooms or spaces [i.e. less than 1.85 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, which could lead to harm to persons.

*Intent 2.* To limit the probability, where provision of a minimum 2.0 m clear height may be cost-prohibitive, that an inadequate clear height of rooms or spaces [i.e. less than 1.85 m high] will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.5.3.1.(4)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that an inadequate height in the path of access to, or egress from, the room will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, which could lead to harm to persons.

*Intent 2.* To limit the probability that, in an emergency, an inadequate height in the path of access to, or egress from, the room will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.5.3.2.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that insufficient ceiling height will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, which could lead to harm to persons.

*Intent 2.* To limit the probability that insufficient ceiling height will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads in an emergency, which could lead to delays in evacuation or movement to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.5.3.3.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that inadequate height of rooms or spaces will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, in areas that are used infrequently or for a limited time, which could lead to harm to persons.

*Intent 2.* To limit the probability that, in an emergency, inadequate heights of rooms or spaces will lead to collision with protrusions from ceilings, such as lighting fixtures, ceiling fans and low door heads, in areas that are used infrequently or for a limited time, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.5.4.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an inadequate hallway width will impede egress during an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.5.5.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- insufficiently wide doorway openings, which could lead to difficulty in negotiating doorways, and
- insufficiently high doorway openings, which could lead to accidental collision with door heads.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of:

- insufficiently wide doorway openings, which could lead to difficulty in negotiating doorways in an emergency, and
- insufficiently high doorway openings, which could lead to accidental collision with door heads in an emergency.

This is to limit the probability of delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.5.5.1.(2)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7] [F30-OS3.1]

**Intent(s)**

*Intent 1.* To exempt doors within secondary suites from the requirement of Sentence (1) which would otherwise require that doors conform to sizes in Table 9.5.5.1., on the basis that accommodating taller doors may be cost prohibitive.

*Intent 2.* To limit the probability of insufficiently high doorway openings, which could lead to accidental collision with door heads, which could lead to harm to persons.

*Intent 3.* To limit the probability of insufficiently high doorway openings, which could lead to accidental collision with door heads in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.5.5.2.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate door widths, which could lead to difficulty in negotiating doorways, which could lead to harm to persons.

*Intent 2.* To limit the probability of inadequate door heights, which could lead to accidental collision with door heads, which could lead to harm to persons.

*Intent 3.* To limit the probability of inadequate door widths, which could lead to difficulty in negotiating doorways in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 4.* To limit the probability of inadequate door heights, which could lead to accidental collision with door heads in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.5.5.3.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Article 9.5.5.3.

**Provision: 9.5.5.3.(2)**

---

**Objective**

OA2

**Attributions**

[F74-OA2]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of a person using a manual wheelchair or other manual mobility assistance device being unable to gain access to a bathtub, shower or water-closet room without the assistance of another person, where hallways serving rooms with a bathtub, shower or water-closet are wide enough to accommodate a wheelchair.

---

### **Provision: 9.6.1.1.(1)**

### **Intent(s)**

*Intent 1.* To state the application of Section 9.6.

---

### **Provision: 9.6.1.2.(1)**

### **Objective**

OS2

### **Attributions**

[F20-OS2.1] [F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of glass will fall significantly below expectations, which could lead to failure, which could lead to harm to persons.

*Intent 2.* [Clauses 9.6.1.2.(1)(e) and 9.6.1.2.(1)(h)] To limit the probability that the performance of insulating glass will fall significantly below expectations, which could lead to inadequate control of heat transfer, which could lead to compromised structural integrity of window assemblies and adjacent exterior wall assemblies, which could lead to condensation on interior glass surfaces, which could lead to deterioration, which could lead to harm to persons.

---

### **Objective**

OH1

### **Attributions**

9.6.1.2.(1)(e), 9.6.1.2.(1)(h) [F63-OH1.1] [F51, F63-OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of insulating glass will fall significantly below expectations, which could lead to the inadequate control of heat transfer, which could lead to:

- the inadequate control of temperatures in interior spaces, or
- condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of windows or adjacent exterior wall assemblies.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

9.6.1.2.(1)(g) [F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of wired safety glass will fall significantly below expectations, which could lead to failure, which could lead to the spread of fire to adjacent fire compartments, which could lead to harm to persons.

**Provision: 9.6.1.2.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of mirrored glass doors, with respect to strength, will fall significantly below expectations, which could lead to the glass being unable to resist impact loads, which could lead to glass breakage, which could lead to harm to persons.

*Intent 2.* To limit the probability that the performance of mirrored glass doors, with respect to strength, will fall significantly below expectations, which could lead to the glass being unable to resist loads imposed by persons who mistake mirrored glass doors for an access to exit in an emergency, and who collide with such doors, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.6.1.3.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of glazing, with respect to structural design, will fall significantly below expectations, which could lead to an inability to support expected impact or wind loads, which could lead to breakage, which could lead to harm to persons.

**Provision: 9.6.1.3.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of an excessive area of glass in the door, which could lead to the glass being unable to resist wind and impact loads, which could lead to glass breakage, which could lead to harm to persons.

*Intent 2.* To limit the probability of an excessive area of glass in the door, which could lead to the glass being unable to resist wind and impact loads in an emergency, which could lead to glass breakage, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency, which could lead to harm to persons.

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of glass in sidelights and doors, with respect to strength, will fall significantly below expectations, which could lead to the glass being unable to resist accidental impact loads from people or objects, which could lead to glass breakage, which could lead to harm to persons.

*Intent 2.* To limit the probability that the performance of glass in sidelights and doors, with respect to strength, will fall significantly below expectations, which could lead to the glass being unable to resist accidental impact loads from people or objects in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency, which could lead to glass breakage, which could lead to harm to persons.

---

### **Provision: 9.6.1.4.(2)**

#### **Intent(s)**

*Intent 1.* To expand the application of Sentence 9.6.1.4.(1) to include glass in doors other than storm or sliding doors.

---

### **Provision: 9.6.1.4.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate marking or protection of transparent panels, which could lead to collisions, which could lead to glass breakage, which could lead to harm to persons.

*Intent 2.* To limit the probability of inadequate marking or protection of transparent panels, which could lead to collisions in an emergency, which could lead to glass breakage, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.6.1.4.(4)**

**Intent(s)**

*Intent 1.* To exempt sliding glass partitions that separate public corridors from adjacent occupancies and that are normally open and out of the way during working hours, and therefore do not present a danger to persons, from the application of Sentences 9.6.1.4.(2), 9.6.1.4.(3) and 9.6.1.4.(5).

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7] Applies to portion of Code text: "... except that such *partitions* shall be suitably marked to indicate their existence and position."

**Intent(s)**

*Intent 1.* To limit the probability that persons will not be able to see the transparent panel and will collide with it, which could lead to falls, which could lead to harm to persons.

*Intent 2.* To limit the probability that, in an emergency, persons will not be able to see a transparent panel and will collide with it, which could lead to falls, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.6.1.4.(5)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of the use of inappropriate hardware, bars or fixtures, which could lead to an inability to identify doors or their position (open or closed), which could lead to collision, which could lead to glass breakage, which could lead to harm to persons.

*Intent 2.* To limit the probability of the use of inappropriate hardware, bars or fixtures, which could lead to an inability to identify doors or their position (open or closed) in an emergency, which could lead to collision, which could lead to glass breakage, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

#### **Objective**

OH1

#### **Attributions**

[F42, F55, F61, F62, F63-OH1.1]

[F81-OH1.1] Applies to windows that provide required non-heating season ventilation.

[F54, F55, F61, F62, F63-OH1.2] [F61, F62, F63-OH1.3]

#### **Intent(s)**

**Intent 1.** To limit the probability that the windows, doors and skylights will have inadequate resistance to loads imposed upon them by structural forces, air pressure or water penetration, or that they offer insufficient protection against the ingress of insect and vermin, which could lead to:

- precipitation into interior space,
- leakage of air induced by air pressure difference due to wind loads,
- damage or structural failure due to snow loads on skylights or where windows have sloped or near-horizontal components,
- infestation by insects and vermin, or
- excessive force required for operation of windows, doors and skylights, which could lead to inadequate ventilation, where windows are required for non-heating season ventilation.

This is to limit the probability of:

- the inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- condensation on the surface of building elements and within assemblies, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F55, F61-OS2.1, OS2.3]

**Intent(s)**

**Intent 1.** To limit the probability that the windows, doors and skylights will have inadequate resistance to loads imposed upon them by structural forces, air pressure or water penetration, or that they have insufficient protection against the ingress of insects and vermin, which could lead to:

- precipitation into interior space,
- leakage of air induced by air pressure difference due to wind loads, water and snow ingress,
- damage or structural failure due to snow loads on skylights or where windows have sloped or near-horizontal components, or
- infestation by insects and vermin.

This is to limit the probability of:

- damage or structural failure, or
- deterioration and resultant damage to environmental separators.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20, F22-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the storm doors for sliding doors and their components will have:

- insufficient resistance to wind loads, which could lead to the storm door being blown out of its tracks by wind forces, or
- excessive resistance to wind loads, which could lead to the storm door deflecting, which could lead to the storm door becoming dislodged.

This is to limit the probability of sliding doors being damaged, which could lead to ingress of precipitation, which could lead to damage and deterioration, which could lead to compromised structural integrity of sliding door assembly and adjacent exterior wall assemblies, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F30-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the storm doors for sliding doors and their components will have:

- insufficient resistance to wind loads, which could lead to the storm door being blown out of its tracks by wind forces, or
- excessive resistance to wind loads, which could lead to the storm door deflecting, which could lead to the storm door becoming dislodged.

---

## Intent Statements: NBC 2010

This is to limit the probability of storm doors for sliding doors falling from buildings, which could lead to harm to persons.

---

### Objective

OH1

### Attributions

[F20, F61-OH1.1, OH1.2]

### Intent(s)

*Intent 1.* To limit the probability that the storm doors for sliding doors and their components will have:

- insufficient resistance to wind loads, which could lead to the storm door deflecting, which could lead to ingress of precipitation.
- insufficient airtightness, which could lead to condensation on the inside of the storm door component, or
- excessive air leakage, which could lead to excessive heat loss, where the sliding door assembly is single-glazed.

This is to limit the probability of damage and deterioration of the environmental separator in which the sliding door is installed, which could lead to compromised structural integrity, which could lead to structural damage, which could lead to harm to persons.

---

### Objective

OS4

### Attributions

[F34-OS4.1]

### Intent(s)

*Intent 1.* To limit the probability that locked storm doors for sliding doors can be easily opened with simple tools by untrained persons, which could lead to unwanted entry, which could lead to harm to persons.

---

## Provision: 9.7.3.1.(5)

---

### Intent(s)

*Intent 1.* To direct Code users to Subsections 9.7.4., 9.7.5. and 9.7.6.

*Intent 2.* To expand the application of Part 5 to the design, construction and installation of windows, doors and skylights in buildings to which Part 9 applies.

---

## Provision: 9.7.3.2.(1)

---

### Objective

OH1

### Attributions

[F51, F63-OH1.1, OH1.2]

### Intent(s)

*Intent 1.* To limit the probability that windows, doors and skylights and their components will have insufficient resistance to heat transfer, which could lead to:

- excessively low temperatures of interior surfaces, or
- condensation, which could lead to

---

## **Intent Statements: NBC 2010**

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that windows, doors and skylights and their components will have insufficient resistance to heat transfer, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of the building, which could lead to harm to persons.

---

### **Provision: 9.7.3.2.(2)**

### **Intent(s)**

*Intent 1.* To direct Code users to Article 9.7.3.3.

*Intent 2.* To expand the application of Part 5 to the design, construction and installation of windows, doors and skylights and their components with regard to their heat transfer performance in buildings to which Part 9 applies.

---

### **Provision: 9.7.3.3.(1)**

### **Objective**

OH1

### **Attributions**

[F63-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to thermal conduction, which could lead to excessive cooling of the interior surfaces of metal frames and adjacent air, which could lead to condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity or performance of windows, doors or skylights, or of building components protected by such components.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to thermal conduction, which could lead to excessive cooling of the interior surfaces of metal frames and adjacent air, which could lead to condensation.

This is to limit the probability of deterioration, which could lead to negative effects on the structural integrity of windows, doors or skylights or of adjacent building components, which could lead to harm to persons.

---

**Provision: 9.7.3.3.(2)**

---

**Intent(s)**

*Intent 1.* To exempt metal frames of windows and doors from the requirements for a thermal break, on the basis that they are installed as:

- vehicular access doors,
- storm windows and doors, or
- windows and doors that are required to have a fire-resistance rating, where:
- practical construction limitations outweigh the need for thermal protection (vehicular access doors),
- thermally broken layers are inherent to the design (storm windows and doors), or
- other Code considerations take precedence (required fire-resistance rating).

---

**Provision: 9.7.3.3.(3)**

---

**Objective**

OH1

**Attributions**

[F63-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to thermal conduction or an inadequate resistance to condensation, which could lead to excessive cooling of the interior surfaces of frames, glazing or adjacent air, which could lead to condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity or performance of windows, doors and skylights or of building components protected by such components.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to thermal conduction or an inadequate resistance to condensation, which could lead to excessive cooling of the interior surfaces of frames, glazing or adjacent air, which could lead to condensation.

This is to limit the probability of deterioration, which could lead to negative effects on the structural integrity of building components, which could lead to harm to persons.

---

## **Provision: 9.7.3.3.(4)**

---

### **Objective**

OH1

### **Attributions**

[F63-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to condensation in high-humidity environments, which could lead to excessive condensation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity or performance of windows, doors and skylights or of building components protected by such components.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F63-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to condensation in high-humidity environments, which could lead to excessive condensation, which could lead to deterioration, which could lead to compromised integrity or performance of windows, doors including sidelights, skylights or of building components protected by such components doors or sidelights.

This is to limit the probability of negative effects on the structural integrity of building components, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F63-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate resistance to condensation in high-humidity environments, which could lead to excessive condensation, which could lead to accumulation of water on walking surfaces.

This is to limit the probability of persons slipping on wet interior walking surfaces, which could lead to harm to persons.

**Provision: 9.7.4.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.7.4.

**Provision: 9.7.4.2.(1)**

---

**Objective**

OH1

**Attributions**

[F20, F55, F61, F62, F63-OH1.1]

[F81-OH1.1] Applies to windows that provide required non-heating season ventilation.

[F54, F55, F61, F62, F63-OH1.2] [F20, F61, F62, F63-OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of windows, doors and skylights will fall significantly below expectations with respect to:

- resistance to air pressure loads,
- resistance to structural loads,
- resistance to water penetration loads,
- resistance to snow loads on skylights or where windows have sloped or near-horizontal components,
- resistance to forced entry, and
- ease of operation.

This is to limit the probability of:

- excessive air leakage,
- excessive heat loss or gain,
- condensation,
- precipitation and melt water ingress,
- insufficient protection against the ingress of insects and vermin, or
- inoperability or excessive difficulty in operating doors and openable windows.

This is to limit the probability of:

- the inadequate control of temperatures of interior spaces, relative humidity, drafts, or water accumulation,

---

## **Intent Statements: NBC 2010**

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of exterior wall assemblies, or
- inadequate ventilation where windows, doors and skylights provide required non-heating-season ventilation.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20, F21, F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of windows, doors and skylights will fall significantly below expectations with respect to:

- resistance to air pressure loads, which could lead to excessive deflection,
- resistance to structural loads including snow loads on skylights or where windows have sloped or near-horizontal components, which could lead to insufficient strength, and
- resistance to water penetration loads and the capability to dissipate water, which could lead to precipitation ingress or condensation.

This is to limit the probability of:

- damage or structural failure due to snow loads on skylights or where windows have sloped or near-horizontal components,
- compromised structural integrity of window, door or skylight assemblies and adjacent exterior wall assemblies, or
- precipitation ingress or condensation, which could lead to deterioration, which could lead to compromised structural integrity of such assemblies and adjacent exterior wall assemblies.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F10-OS1.5] Applies where windows, doors or skylights serve bedrooms, except bedrooms that have direct access to the exterior through an *exit* door or bedrooms that are in *sprinklered suites*.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of windows, doors and skylights will fall significantly below expectations with respect to ease of operation.

This is to limit the probability that, in a fire, all means of egress will be blocked, which could lead to persons being trapped in a bedroom, which could lead to harm to persons.

---

### **Intent(s)**

*Intent 1.* To clarify that compliance with the remainder of this Subsection and with Subsection 9.7.6. is required.

**Provision: 9.7.4.3.(1)**

---

**Objective**

OH1

**Attributions**

[F20, F55, F61-OH1.1]

[F55-OH1.2] [F20, F61, F62-OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of windows, doors and skylights is not adequate for the climatic conditions and the location where the windows, doors and skylights will be installed, with respect to:

- resistance to wind loads,
- resistance to driving rain wind pressure
- resistance to water penetration loads, and
- resistance to snow loads on skylights or where windows have sloped or near-horizontal components.

This is to limit the probability of:

- excessive air leakage,
- excessive heat loss or gain,
- condensation, or
- precipitation and melt water ingress.

This is to limit the probability of:

- the inadequate control of temperatures of interior spaces, relative humidity, drafts, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, and
- deterioration, which could lead to compromised integrity of exterior wall assemblies.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.7.4.3.(2)**

---

**Intent(s)**

*Intent 1.* To clarify that the procedure for the selection of acceptable windows, doors and skylights necessitates the determination of specified design test pressures (performance grades) according to the Canadian Supplement (Clause 2010-5.10.2.4.(1)(b)) for each specific location, in which windows, doors and skylights are installed.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate level of performance for windows, doors and skylights, which could lead to failure of the windows, doors and skylights with respect to their resistance to:

- precipitation into interior space,
- leakage of air induced by air pressure difference due to wind loads,
- damage or structural failure due to snow loads on skylights or where windows have sloped or near-horizontal components,
- infestation by insects and vermin, or
- excessive force required for operation of windows, doors and skylights.

This is to limit the probability of:

- the inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- condensation on the surface of building elements and within assemblies, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

### **Provision: 9.7.4.3.(4)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F61, F42-OH1.1] [F51, F54-OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of exterior wood doors will fall significantly below expectations, which could lead to:

- infestation by insects or vermin,
- precipitation ingress,
- excessive heat transfer, or
- excessive air infiltration or exfiltration.

This is to limit the probability of:

- the ingress of airborne pollutants,

- the inadequate control of temperatures in interior spaces, or drafts,
- generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by doors.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61, F42-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of exterior wood doors will fall significantly below expectations, which could lead to:

- infestation by insects or vermin, or
- precipitation ingress.

This is to limit the probability of the deterioration of elements protected by doors, which could lead to compromised structural integrity of such elements, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F80-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of exterior wood doors will fall significantly below expectations, which could lead to deterioration at an unacceptable rate or inoperability of doors, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency, which could lead to harm to persons.

---

**Objective**

OS4

**Attributions**

[F80-OS4.1]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of exterior wood doors will fall significantly below expectations, which could lead to doors deteriorating at an unacceptable rate or not closing properly, which could lead to unwanted entry, which could lead to harm to persons.

---

OH2

**Attributions**

[F42-OH2.5]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that the performance of exterior wood doors will fall significantly below expectations, which could lead to infestation by insects or vermin, which could lead to unsanitary conditions, which could lead to harm to persons.

---

### **Provision: 9.7.5.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.7.5.

*Intent 2.* To expand the application of Subsections 9.7.4. and 9.7.6.

*Intent 3.* To expand the application of Part 5 to include Part 9 buildings.

---

### **Provision: 9.7.5.1.(2)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.6., which applies to glass in site-built windows, doors, sidelights for doors and skylights.

---

### **Provision: 9.7.5.2.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Article 9.7.5.2.

*Intent 2.* To exempt exterior doors to garages and to other ancillary spaces from the application of Article 9.7.5.2.

---

### **Provision: 9.7.5.2.(2)**

#### **Objective**

OS4

#### **Attributions**

[F34-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate level of security, which could lead to unwanted entry, which could lead to harm to persons.

*Intent 2.* To exempt doors, frames and hardware that otherwise address resistance to unwanted entry from the application of Sentences 9.7.5.2.(3)to 9.7.5.2.(7)

---

### **Provision: 9.7.5.2.(3)**

#### **Objective**

OS4

#### **Attributions**

[F20-OS4.1]

#### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of using swinging doors with inadequate strength, which could lead to inadequate resistance to physical attack, which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.2.(4)**

#### **Objective**

OS4

#### **Attributions**

[F34-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the absence of locks or of using locks with inadequate properties, which could lead to inadequate resistance to physical attack (e.g., picking of lock, removal of cylinder, spreading of jambs or forcing latches to disengage by the use of a device to push back latches), which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.2.(5)**

#### **Objective**

OS4

#### **Attributions**

[F34-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the absence of latches or of using latches with inadequate properties, which could lead to inadequate resistance to physical attack, which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.2.(6)**

#### **Objective**

OS4

#### **Attributions**

[F20-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of using an inadequate number or length of fasteners or an inadequate fastener penetration depth, which could lead to inadequate resistance to physical attack (e.g. prying or impact forces), which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.2.(7)**

#### **Objective**

OS4

#### **Attributions**

[F20-OS4.1]

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of using an inadequate type or length of strikeplate fasteners, which could lead to inadequate resistance to physical attack (e.g. prying or impact forces), which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.2.(8)**

#### **Objective**

OS4

#### **Attributions**

[F34-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of the removal of hinge pins from the exterior when doors are closed, which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.2.(9)**

#### **Objective**

OS4

#### **Attributions**

[F20-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support of locks, which could lead to an inability to resist loads imposed by intruders trying to spread the frame away from the door, which could lead to forcing bolts from their strike plates, which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.5.3.(1)**

#### **Objective**

OS4

#### **Attributions**

[F34-OS4.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that windows will be unable to resist efforts at forced entry, which could lead to unwanted entry, which could lead to harm to persons.

---

### **Provision: 9.7.6.1.(1)**

#### **Objective**

OH1

#### **Attributions**

[F20, F54, F55, F61, F63-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the installation of windows, doors, and skylights will fall significantly below expectations, which could lead to:

- inadequate fastening of frames to the structure,
- inadequate mulling of combination units, or
- inadequate selection of fasteners.

This is to limit the probability of:

- inadequate control of air leakage,
- precipitation into interior space,
- structural damage due to wind loads or snow loads on skylights or where windows have sloped or near-horizontal components, or
- excessive force required for operation of windows, doors and skylights, which could lead to inadequate ventilation, where windows are required for non-heating season ventilation.

This is to limit the probability of:

- water accumulation or condensation on the surface of building elements and within assemblies,
- the inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

[F20, F61, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the installation will fall significantly below expectations, which could lead to:

- inadequate fastening of frames to the structure,
- inadequate mulling of combination units, or
- inadequate selection of fasteners.

This is to limit the probability of:

- inadequate control of air leakage,
- precipitation into interior space,
- structural damage due to wind loads or snow loads on skylights or where windows have sloped or near-horizontal components.

This is to limit the probability of:

- condensation or water accumulation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, or
- structural failure of windows, doors or skylights.

This is to limit the probability of harm to persons.

---

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To clarify that treated plywood shims are acceptable and that other Code requirements (Article 9.27.3.8.) for the preparation of the rough opening and the installation of flashing govern over requirements in the standard.

### **Provision: 9.7.6.1.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F54, F55, F61, F63-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the installation of field-assembled, manufactured or pre-assembled windows, doors, and skylights will fall significantly below expectations.

This is to limit the probability of:

- premature deterioration of materials and components used for the installation,
- condensation on the surface of building elements and within assemblies,
- precipitation into interior space, or
- leakage of air induced by air pressure difference due to wind loads.

This is to limit the probability of:

- structural damage due to snow loads on skylights or where windows have sloped or near-horizontal components,
- the ingress of insects and vermin,
- excessive force required for operation of windows, doors and skylights, which could lead to inadequate ventilation, where windows are required for non-heating season ventilation
- the inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

### **Intent(s)**

*Intent 1.* To limit the probability that the installation of field-assembled, manufactured or pre-assembled windows, doors, and skylights will fall significantly below expectations.

This is to limit the probability of:

- premature deterioration of materials and components used for the installation,
- condensation on the surface of building elements and within assemblies,
- precipitation into interior space, or
- leakage of air induced by air pressure difference due to wind loads.

This is to limit the probability of:

- structural damage due to snow loads on skylights or where windows have sloped or near-horizontal components, and
- condensation or water accumulation, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators.

This is to limit the probability of harm to persons.

---

**Provision: 9.7.6.1.(3)**

---

**Objective**

OS2

**Attributions**

[F55, F61, F63-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of uncontrolled air leakage and uncontrolled vapour diffusion between walls and windows or doors, and between ceilings and skylights, which could lead to condensation on the surface of building elements and within assemblies, which could lead to deterioration, which could lead to compromised structural integrity of assemblies acting as environmental separators, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F55, F61, F63-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of uncontrolled air leakage and uncontrolled vapour diffusion between walls and windows or doors, and between ceilings and skylights, which could lead to

- condensation on the surface of building elements or within building elements,
- excessive heat loss or gain,
- precipitation ingress, or
- ingress of insect and vermin.

This is to limit the probability of:

- the inadequate control of temperatures of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and

---

## **Intent Statements: NBC 2010**

- contact with moisture.

This is to limit the probability of harm to persons.

### **Provision: 9.7.6.2.(1)**

---

*Intent 1.* To limit the probability of premature failure of the glass-to-sash seal or of the edge seal of the glass component, which could lead to:

- condensation,
- precipitation ingress,
- inadequate control of temperatures in interior spaces,
- drafts, or
- water accumulation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of windows or adjacent exterior wall assemblies, or
- the generation of pollutants from the chemical reaction of incompatible sealants.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F61, F63-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of premature failure of the glass-to-sash seal or of the edge seal of the glass component, which could lead to compromised structural integrity of window assemblies and adjacent exterior wall assemblies, which could lead to wetting from condensation on the interior surface of windows or precipitation ingress, which could lead to deterioration, which could lead to harm to persons.

### **Provision: 9.7.6.2.(2)**

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Articles 9.27.3.7. and 9.27.3.8., which contain requirements for the protection of openings for windows, doors and skylights.

---

**Provision: 9.7.6.2.(3)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.27.4., which contains sealing requirements.

---

**Provision: 9.7.6.2.(4)**

---

**Objective**

OS2

**Attributions**

[F80-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of a chemical reaction between aluminum and alkali, which could lead to the premature failure of aluminum flashing, which could lead to precipitation or meltwater ingress, which could lead to deterioration of the cladding assembly or of elements inboard of the cladding, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F80-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of a chemical reaction between aluminum and alkali, which could lead to the premature failure of aluminum flashing, which could lead to precipitation or meltwater ingress, which could lead to deterioration of the cladding assembly or of elements inboard of the cladding, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of a chemical reaction between aluminum and alkali, which could lead to the premature failure of aluminum flashing, which could lead to:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.1.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Section 9.8.

---

### **Provision: 9.8.1.2.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of the requirements that apply to stairs, ramps, landings, handrails and guards in dwelling units to stairs, ramps, landings, handrails and guards in garages that serve a single dwelling unit or a house with a secondary suite, on the basis that these are used in the same manner and pose no greater hazard.

---

### **Provision: 9.8.1.3.(1)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Sections 9.9. and 9.10., which contain additional requirements related to exit stairs, ramps and landings.

---

### **Provision: 9.8.1.4.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Part 3 [more specifically Sentences 3.5.2.1.(1) and 3.5.2.1.(2)] to include escalators and moving walkways in Part 9 buildings.

---

### **Provision: 9.8.2.1.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that stairs will be of inadequate width for users to pass one another without difficulty, in buildings where occupant load would not be expected to have implications for required width, which could lead to:

- persons colliding and falling, or
- restricted egress during an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.2.1.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that stairs will be of inadequate width, which could lead to:

- persons colliding and falling, or
- persons colliding and falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that stairs will be of inadequate width for users to pass one another without difficulty, which could lead to:

- persons colliding and falling, or
- restricted egress during an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.2.1.(4)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate stair width, which could lead to:

- persons colliding and falling, or
- persons colliding and falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.2.2.(1)**

---

**Intent(s)**

*Intent 1.* To clarify how to measure the clear height over stairs.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.8.2.2.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over stairs in other than single dwelling unit and a house with a secondary suite, where occupants might not be familiar with their surroundings.

This is to limit the probability of:

- persons accidentally contacting the ceiling with their head, or
- persons accidentally contacting the ceiling with their head in an emergency, which could lead to persons falling, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.2.2.(3)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over stairs in single dwelling units or houses with secondary suites (1.95 m), where occupants are likely to be intimately familiar with their surroundings.

This is to limit the probability of:

- persons accidentally contacting the ceiling with their head, or
- persons accidentally contacting the ceiling with their head in an emergency, which could lead to persons falling, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.2.2.(4)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over stairs where such stairs are provided under beams or ducting in secondary suites.

This is to limit the probability of:

- persons accidentally contacting the ceiling with their head, or

- persons accidentally contacting the ceiling with their head in an emergency, which could lead to persons falling, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.3.1.(1)**

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that excessive variance in the configuration of a stair will excessively disrupt the gait of users, which could lead to:

- persons misstepping and tripping, or
- persons misstepping and tripping in an emergency -- when traffic flow is expected to be limited owing to the presence of exit stairs as an alternate option or to the limited number of occupants in dwelling units -- which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.3.1.(2)**

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that excessive variance in the configuration of stairs within dwelling units will excessively disrupt the gait of users, which could lead to persons misstepping and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.3.1.(3)**

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of multiple sets of winders in a single flight of stairs, which could lead to an excessive disruption of the natural gait of users, which could lead to:

- persons misstepping and falling, or
- persons misstepping and falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

### **Provision: 9.8.3.2.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that users will not see the steps, which could lead to:

- persons tripping or falling, or
- persons tripping or falling in an emergency, which could lead to delays in evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.3.3.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that excessive vertical distance between landings will lead to users falling a long distance in the event of a fall, which could lead to harm to persons.

*Intent 2.* To limit the probability that an excessively long, uninterrupted ascent will lead to users becoming exhausted, which could lead to users having heart attacks or similar accidents, which could lead to harm to persons.

### **Provision: 9.8.4.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- incompatibility between the height of risers and the average user's stride, or
- excessively steep stairs, which could lead to excessive effort required to climb the stairs.

This is to limit the probability of:

- persons misstepping or tripping, or
- persons misstepping or tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.4.2.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of:

- insufficient tread depth,
- incompatibility between the height of risers and the average user's stride,
- insufficient room to accommodate the length of user's foot, or
- excessively steep stairs.

This is to limit the probability of:

- persons misstepping or tripping, or
- persons misstepping or tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.4.2.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability:

- that users will place their foot off the tread or incorrectly place their foot on the tread, or
- of excessive depth beyond the nosing of the upper tread, which could lead to users positioning their foot too far under the upper tread.

This is to limit the probability of:

- persons misstepping or tripping, or
- persons misstepping or tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.4.3.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Article 3.4.6.9. to include angled treads in required exit stairs of Part 9 buildings, where the stairs are curved.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.8.4.3.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an insufficient run in a curved stair will not provide adequate support for users' feet, which could lead to:

- persons falling during normal use -- when traffic flow is likely to be lower than for exit stairs during an emergency and users are likely to have the option of using the wider portion of the treads, or
- persons falling in an emergency -- when traffic flow is expected to be limited because of the presence of exit stairs as an alternate or the limited occupancy in a dwelling unit, and users are likely to have the option of using the wider portion of the treads -- which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

This is to limit the probability of harm to persons.

### **Provision: 9.8.4.3.(3)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability:

- that users will place their foot off the tread or incorrectly place their foot on the tread, or
- of excessive depth beyond the nosing of the upper tread, which could lead to users positioning their foot too far under the upper tread.

This is to limit the probability of:

- persons misstepping or tripping, or
- persons misstepping or tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.4.4.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that a non-uniform rise will lead to:

- persons misstepping and tripping, or

- persons misstepping and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.4.4.(2)**

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To relax the requirement stated in Sentence 9.8.4.4.(1) in cases where the top or bottom riser of flights of stairs adjoins a sloping finished walking surface.

This is to limit the probability that non-uniform rise will lead to

- persons misstepping and tripping, or
- persons misstepping and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.4.4.(3)**

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that a non-uniform run will lead to:

- persons misstepping and tripping, or
- persons misstepping and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.4.4.(4)**

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that excessive variance in the configuration of a flight of stairs will excessively disrupt the gait of users or force them to switch to the other side of the stair, which could lead to:

- persons misstepping and tripping, or
- persons misstepping and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

### **Provision: 9.8.4.4.(5)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an excessive slope on treads will lead to:

- persons misstepping, sliding and tripping, or
- persons misstepping, sliding and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.4.5.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that a mismatch between winder configuration and the natural gait of most users will lead to:

- persons misstepping and falling, or
- persons misstepping and falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To modify the application of Sentence 9.8.4.3.(2) for uniformity of treads in stairs within dwelling units where the occupant load is low and occupants are likely to be familiar with their surroundings, on the basis that a specific stair configuration has traditionally been used extensively within dwelling units without dramatic consequences for the safety of persons and that experience warrants its continued use.

### **Provision: 9.8.4.5.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an excessive number of angled steps will lead to:

- persons falling a long vertical distance along the winders, or
- persons falling a long vertical distance along the winders in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.4.6.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that the top of the nosings of stair treads will not provide sufficient light modeling, which could lead to their location being difficult for the user to see, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of:

- excessively wide, sloped or curved portions of treads,
- an insufficient usable tread depth.

This is to limit the probability of:

- persons slipping, tripping or falling, or
- persons slipping, tripping or falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 3.* To limit the probability that a person tripping and falling against the leading edge of a stair tread will be harmed.

**Provision: 9.8.4.6.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that, where the finish material provides some cushioning, a person tripping and falling against the leading edge of a stair tread will be harmed.

**Provision: 9.8.5.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.8.5.

**Provision: 9.8.5.1.(2)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To modify the application of Article 3.8.3.4. to apply to Part 9 buildings that are required [in Sentence 9.5.2.1.(1)] to include a barrier-free path of travel.

*Intent 2.* Also to modify the application of Article 9.8.5.2. to 9.8.5.5.

---

### **Provision: 9.8.5.2.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that ramps will be of insufficient width, which could lead to:

- persons colliding or falling, or
- persons colliding or falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.5.2.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that ramps will be of insufficient width, in dwelling units where the number of occupants is limited, which could lead to:

- persons colliding or falling, or
- persons colliding or falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.5.2.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that ramps will be of insufficient width, which could lead to:

- persons colliding or falling, or
- persons colliding or falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.5.3.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over ramps within other than a single dwelling unit or a house with a secondary suite including common spaces where occupants might not be familiar with their surroundings.

This is to limit the probability of users accidentally contacting the ceiling with their head, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.5.3.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over ramps serving a single dwelling unit or a house with a secondary suite including common spaces where occupants are likely to be intimately familiar with their surroundings.

This is to limit the probability of users accidentally contacting the ceiling with their head, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.5.4.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of an excessively steep slope in areas that are not intended to be barrier-free:

- under difficult surface conditions related to the weather, in the case of exterior ramps,

---

## **Intent Statements: NBC 2010**

- in residential occupancies, where users may include those with a limited ability to negotiate ramps,
- in mercantile or industrial occupancies, where users are likely to be better able to negotiate ramps, and
- in other occupancies, where users are likely to be able to negotiate ramps, but are present in significant numbers, or are unlikely to use ramps without assistance.

This is to limit the probability of:

- persons losing their balance, or
- persons losing their balance in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.5.5.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that an excessively long, uninterrupted descent will lead to users gaining excessive speed, which could lead to persons falling, which could lead to harm to persons.

*Intent 2.* To limit the probability that an excessively long, uninterrupted ascent will lead to users becoming exhausted, which could lead to users having heart attacks or similar accidents, which could lead to harm to persons.

---

### **Provision: 9.8.6.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.8.6.

---

### **Provision: 9.8.6.1.(2)**

#### **Intent(s)**

*Intent 1.* To expand the application of Article 3.8.3.4. to Part 9 buildings that are required [in accordance with Sentence 9.5.2.1.(1)] to include a barrier-free path of travel.

*Intent 2.* To supersede the application of Article 9.8.6.2. to Article 9.8.6.4.

---

### **Provision: 9.8.6.1.(3)**

#### **Intent(s)**

*Intent 1.* To define what is to be considered as a landing.

**Provision: 9.8.6.2.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate clear surface for users to adjust their gait when entering or exiting a flight of stairs, or for users to turn to negotiate a doorway in a stairway, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.6.2.(2)**

---

**Intent(s)**

*Intent 1.* To exempt from the application of the requirement for a landing in Sentence 9.8.6.2.(1), situations where a landing is provided when the door is opened, and users are likely to be familiar with the stair.

**Provision: 9.8.6.2.(3)**

---

**Intent(s)**

*Intent 1.* To exempt certain stairs from the application of Sentence 9.8.6.2.(1), which would otherwise require a landing, in situations where an entrance with a safer configuration is provided and where users are likely to be familiar with the conditions.

**Provision: 9.8.6.2.(4)**

---

**Intent(s)**

*Intent 1.* To exempt certain stairs or ramps from the application of Sentence 9.8.6.2.(1), which would otherwise require a landing, in situations where an approach to the stair or ramp with a safer configuration is provided.

**Provision: 9.8.6.3.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that landings will have insufficient dimensions to allow users to access the landing, pause, pass other users, or turn without an awkward change in gait, which could lead to:

- persons falling, or

---

## **Intent Statements: NBC 2010**

- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the required length of landings, where longer landings would not significantly reduce the risk of injury, and where:

- users are likely to be familiar with the stair or ramp, or
- the risk of being knocked over by other users is unlikely.

This is to limit the probability that landings will have insufficient dimensions to allow users to access the landing, pause, pass other users, or turn without an awkward change in gait, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.6.3.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To expand the application of Table 9.8.6.3. that applies to stairs and ramps serving a single dwelling unit to also apply to stairs and ramps serving a house with a secondary suite including common spaces.

---

### **Provision: 9.8.6.3.(3)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that landings will have insufficient dimensions to allow users to access the landing, pause, pass other users, or turn without an awkward change in gait, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.6.3.(4)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequately sized standing surface at doors opening towards stairs, which could lead to users stepping back onto the stairs when opening the door and:

- falling, or
- falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.6.3.(5)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that an excessive slope of landings will lead to:

- persons misstepping, sliding and tripping, or
- persons misstepping, sliding and tripping in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.6.3.(6)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that users will step from a doorway or stairway onto the sloped landing surface of a ramp, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.6.4.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over landings, which could lead to users accidentally contacting the ceiling or protrusions from the ceiling with their head, which could lead to:

- persons falling, or

---

## **Intent Statements: NBC 2010**

- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.6.4.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of insufficient clear height over landings serving a single dwelling unit or a house with a secondary suite including common spaces.

This is to limit the probability of users accidentally contacting the ceiling with their head, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.1.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate means of maintaining balance and arresting falls:

- on stairs and ramps that accommodate individual users,
- on stairs and ramps that are sufficiently wide to allow users to pass each other, and
- on stairs and ramps that have a configuration that is inherently more difficult to negotiate.

This is to limit the probability of:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.1.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7] [F30-OS3.1]

#### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of an inadequate means of maintaining balance and arresting falls on stairs and ramps of significant width, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.1.(3)**

#### **Intent(s)**

*Intent 1.* To exempt stairs and ramps from the application of Sentence 9.8.7.1.(1), in situations where the risk of falling is reduced because occupants are likely to be familiar with their surroundings and the risk of injury due to falls is reduced because the vertical fall distance is limited.

---

### **Provision: 9.8.7.1.(4)**

#### **Intent(s)**

*Intent 1.* To supersede the requirements stated in Sentence 9.8.7.1.(1), which would otherwise require 2 handrails, in situations where the risk of falling is reduced because occupants are likely to be familiar with their surroundings and the risk of injury due to falls is reduced because the vertical fall distance is limited.

---

### **Provision: 9.8.7.2.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of unexpected discontinuity of handrails in stairs and ramps, which could lead to the interruption of users' holds on the handrail, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.2.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of unexpected discontinuity of handrails in stairs and ramps, which could lead to the interruption of users' holds on the handrail, which could lead to:

---

## **Intent Statements: NBC 2010**

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To supersede the requirement stated in Sentence (1) regarding the continuity of handrails, in situations where occupants are likely to be familiar with the stair or ramp.

---

### **Provision: 9.8.7.3.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of handrails terminating as protrusions into pathways or otherwise creating a hazard, which could lead to:

- persons colliding, or
- persons colliding in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.3.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* Where users are not likely to be familiar with the stairway or ramp, to limit the probability of an abrupt termination of a handrail at the end of a flight of stairs, which could lead to an inability to establish or maintain a grasp on the handrail when making a transition to or from stairs, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.4.(1)**

#### **Intent(s)**

*Intent 1.* To define the method of measuring the height of handrails.

**Provision: 9.8.7.4.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that handrails will be too high or too low to be used by the majority of stair and ramp users, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.7.4.(3)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* Where the risk of falls and injury is reduced owing to the large flat surface of the landing, to limit the probability that handrails will be too high to be used by the majority of stair and ramp users, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To supersede the requirement stated in Sentence (2) regarding the maximum height of handrails, in situations where guards are required and the top of the guards can be used as handrails.

**Provision: 9.8.7.4.(4)**

---

**Intent(s)**

*Intent 1.* To exempt certain handrails from the maximum and minimum height requirements in Sentence 9.8.7.4.(2), on the basis that such handrails are installed in addition to handrails that already comply with those requirements.

**Provision: 9.8.7.5.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that an inadequate clearance between a handrail and the wall to which it is fastened will lead to users not having a secure grip, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.5.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an inappropriate size, shape or anchoring configuration of handrails will lead to:

- users having difficulty establishing or maintaining their grip, or
- users' hands getting caught.

This is to limit the probability of:

- accidents, or
- accidents in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.6.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that handrails or constructions below handrails will project an excessive distance into the required width of stairways or ramps, which could lead to:

- compromised use of the stairway or ramp, or
- compromised use of the stairway or ramp in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Provision: 9.8.7.7.(1)**

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that handrails and their supports will be designed for insufficient loading values, which could lead to the dislodgement or failure of handrails, which could lead to persons falling, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1, OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that handrails and their supports will be designed for insufficient loading values, which could lead to:

- the excessive deflection or dislodgement of handrails under normal use, which could lead to persons falling, or
- the excessive deflection or dislodgement of handrails being used by persons in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.7.7.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of excessive spacing or inadequate placement of fasteners, or insufficient withdrawal resistance of fasteners, which could lead to the dislodgement of handrails, which could lead to persons falling, which could lead to harm to persons.

*Intent 2.* To provide an alternative to the requirements of Sentence 9.8.7.7.(1), in situations where traditional methods of fastening are used for handrails serving a single dwelling unit.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1, OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of excessive spacing or inadequate placement of fasteners, or insufficient withdrawal resistance of fasteners, which could lead to:

- the excessive deflection or dislodgement of handrails under normal use, which could lead to persons falling, or
- the excessive deflection or dislodgement of handrails being used by persons in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.8.8.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fall protection at significant changes in elevation between adjacent surfaces, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.8.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain work areas from the application of Sentence 9.8.8.1.(1), which would otherwise require guards to be installed, in situations where installing guards at unprotected edges is impractical and workers are aware of the danger.

### **Provision: 9.8.8.1.(3)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate fall protection on interior stairs or ramps where the risk of injury from a fall is greater due to the elevation of the stair or ramp above the finished floor surface, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.8.1.(4)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* At significant changes in elevation between adjacent surfaces, to limit the probability:

- that doors will unintentionally open to their full width, which could lead to inadequate fall protection, or
- that doors will open greater than 100 mm, which could lead to inadequate fall protection for small children.

This is to limit the probability of persons falling, which could lead to harm to persons.

*Intent 2.* To expand the application of Subsection 9.8.8. to include guards for doors.

---

**Provision: 9.8.8.1.(5)****Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability that inadequate fall protection, particularly for children and infants, will lead to falls from a significant height through open windows, which could lead to harm to persons.

*Intent 2.* To expand the application of Section 9.8. to include guards for windows.

---

**Provision: 9.8.8.1.(6)****Intent(s)**

*Intent 1.* To exempt windows where the risk of falling or the harm that would result from a fall is limited from the application of Sentence 9.8.8.1.(5).

---

**Provision: 9.8.8.1.(7)****Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate protection under conditions of crowding in stairs, ramps or landings or for other reasons, which could lead to persons, who are pushed or who lose their balance, falling against windows, which could lead to harm to persons.

*Intent 2.* To limit the probability of inadequate protection under conditions of crowding in stairs, ramps or landings or for other reasons in an emergency, which could lead to persons, who are pushed or who lose their balance, falling against windows, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To expand the application of Subsection 9.8.8. to include certain windows in stairs, ramps or landings.

*Intent 4.* To expand the application of the guard loading requirements in Part 4 [more specifically Article 4.1.5.14.] to certain windows covered in Part 9.

---

## **Intent Statements: NBC 2010**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate protection under conditions of crowding in stairs, ramps or landings or for other reasons, which could lead to persons, who are pushed or who lose their balance, falling against windows, which could lead to harm to persons.

*Intent 2.* To limit the probability of inadequate protection under conditions of crowding in stairs, ramps or landings or for other reasons in an emergency, which could lead to persons, who are pushed or who lose their balance, falling against windows, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To supersede the minimum window height stated in Sentence 9.8.8.1.(7), where the number of occupants is low and their familiarity with the space reduces the likelihood of their falling and injuring themselves.

*Intent 4.* To expand the application of Subsection 9.8.8. to certain windows in stairs, ramps and landings.

*Intent 5.* To expand the application of the guard loading requirements in Part 4 [more specifically Article 4.1.5.14.] to certain windows covered in Part 9.

### **Provision: 9.8.8.1.(9)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that glazing will have inadequate protection, which could lead to persons, who lose their balance, falling through windows, which could lead to harm to persons.

*Intent 2.* To expand the application of Subsection 9.8.8. to include the protection of windows in public areas located above the second storey, in certain circumstances.

*Intent 3.* To expand the application of the guard loading requirements in Part 4 [more specifically Article 4.1.5.14.] to include certain windows covered in Part 9.

### **Provision: 9.8.8.2.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that loads used for the design of guards and their attachment will not be based on the maximum forces expected to be exerted by persons in the context of the use and occupancy of the guarded area, which could lead to structural failure, which could lead to harm to persons.

**Provision: 9.8.8.2.(2)**

---

**Intent(s)**

*Intent 1.* To clarify in what manner the loads stated in Table 9.8.8.2. are to be applied to a 300-mm width on balusters in guards within dwelling units and exterior guards serving not more than 2 dwelling units.

**Provision: 9.8.8.2.(3)**

---

**Intent(s)**

*Intent 1.* To clarify that loads specified in Table 9.8.8.2. need not be considered to act simultaneously.

**Provision: 9.8.8.2.(4)**

---

**Intent(s)**

*Intent 1.* To exempt interior guards within dwelling units and exterior guards serving not more than 2 dwelling units from the application of Sentence 9.8.8.2.(1), where the guard construction used has been demonstrated to provide effective performance.

**Provision: 9.8.8.3.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that guards will not be high enough to provide reasonable fall protection, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.8.3.(2)**

---

**Objective**

OS3

*Intent 1.* To limit the probability that guards will not be high enough to provide reasonable fall protection, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To supersede the guard height requirement stated in Sentence 9.8.8.3.(1), in cases where the risk of falls and injury is reduced because occupants are likely to be familiar with their surroundings.

---

### **Provision: 9.8.8.3.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that guards will not be high enough to provide reasonable fall protection, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To supersede the guard height requirement stated in Sentence 9.8.8.3.(1), in cases where the risk of falling is limited and where occupants are likely to be familiar with their surroundings [see Sentence 9.8.8.3.(2)].

---

### **Provision: 9.8.8.3.(4)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that guards will not be high enough to provide reasonable fall protection, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To supersede the guard height requirement stated in Sentence 9.8.8.3.(1), in cases where the risk of falls and injury is reduced because occupants are likely to be familiar with their surroundings.

---

### **Provision: 9.8.8.3.(5)**

#### **Intent(s)**

*Intent 1.* To clarify how the height of guards for flights of steps is to be measured.

**Provision: 9.8.8.4.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of vehicles rolling over the edge, which could lead to harm to persons in the vehicles or to persons occupying the space below.

*Intent 2.* To clarify that the requirements regarding guards stated in Articles 9.8.8.1. to 9.8.8.3. apply to garages.

**Provision: 9.8.8.4.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability that the horizontal load for the design of a vehicle guardrail, its connections and supporting structure, will not take into account the maximum expected force due to the impact of a vehicle, which could lead to structural failure, which could lead to harm to persons.

**Provision: 9.8.8.5.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of excessively large openings in guards, which could lead to small children falling through the guards or having their head lodged between guard elements, which could lead to harm to persons.

*Intent 2.* In cases where a less stringent requirement is not specifically stated, to limit the probability of excessively large openings in guards, which could lead to adults falling through the guards, which could lead to harm to persons.

**Provision: 9.8.8.5.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* In buildings of an occupancy where unsupervised small children are unlikely to be present, to limit the probability of excessively large openings in guards, which could lead to adults falling through the guards, which could lead to harm to persons.

*Intent 2.* To supersede the requirement stated in Sentence 9.8.8.5.(1) regarding openings through guards, where unsupervised small children are unlikely to be present.

---

### **Provision: 9.8.8.5.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that openings measuring between 100 and 200 mm in non-required guards will allow the body of a small child to pass through but the child's head will likely become trapped, which could lead to harm to the child.

---

### **Provision: 9.8.8.6.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that preschool-aged children will climb guard elements and fall back over the top, which could lead to harm to persons.

---

### **Provision: 9.8.8.6.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that children will climb guard elements and fall back over the top, which could lead to harm to persons.

*Intent 2.* To provide prescriptive criteria as an alternative to the requirement in Sentence 9.8.8.6.(1).

---

### **Provision: 9.8.8.7.(1)**

#### **Objective**

OS3

#### **Attributions**

[F20-OS3.1, OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to expected loads, which could lead to failure of the glass, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of glass breaking into large sharp pieces, which could lead to:

- persons falling onto large pieces of broken glass, or
- persons falling onto large pieces of broken glass in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability that guards and their supports will be designed for insufficient loading values, which could lead to the dislodgment or failure of guards, which could lead to falling guards or persons falling, which could lead to harm to persons.

---

**Provision: 9.8.9.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- the loads for which stairs and ramps are designed will not take into account probable accumulations of people and objects on the floor or roof surface in the context of use and occupancy, and
- the live load on stairs and ramps will be less than the accepted minimum value in the context of use and occupancy.

This is to limit the probability of structural failure, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4]

**Intent(s)**

*Intent 1.* To limit the probability that:

- the loads for which stairs and ramps are designed will not take into account probable accumulations of people and objects on the floor or roof surface in the context of use and occupancy, and
- the loads for which stairs and ramps are designed will be less than the accepted minimum value in the context of use and occupancy.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of excessive deflection or excessive vibration of structural members, which could lead to negative effects on the psychological well-being of persons.

### **Provision: 9.8.9.2.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F22-OS3.1, OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that differential movement of the supporting soil will lead to the tilting of large stair units that are difficult to level, which could lead to:

- persons falling,
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

### **Provision: 9.8.9.2.(2)**

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.8.10., which contains requirements regarding cantilevered precast concrete steps.

### **Provision: 9.8.9.2.(3)**

---

#### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.12., which contains requirements regarding foundations for exterior concrete stairs.

### **Provision: 9.8.9.3.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F80-OS3.1, OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of deterioration at an unacceptable rate, which could lead to steps becoming misaligned, which could lead to:

- persons falling,
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F80-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of premature deterioration of the material, which could lead to structural failure, which could lead to harm to persons.

---

**Provision: 9.8.9.4.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

---

### **Objective**

OH4

### **Attributions**

[F22-OH4]

### **Intent(s)**

*Intent 1.* To limit the probability that stair treads spanning in the weak direction of the material will lead to excessive springiness or excessive deflection, which could lead to user anxiety.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability that stair treads spanning in the weak direction of the material will lead to structural failure, which could lead to harm to persons.

**Provision: 9.8.9.6.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of roughness or unevenness of tread surface, which could lead to:

- persons tripping and falling,
- persons tripping and falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.9.6.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of slippery stair tread and landing surfaces, which could lead to:

- persons falling, or
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

**Provision: 9.8.10.1.(1)**

---

**Objective**

OS3

**Attributions**

[F22-OS3.1, OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of the excessive deflection of steps and non-horizontal treads, which could lead to:

- persons falling,
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of structural failure of the connection between the steps and the foundation wall, which could lead to persons falling, which could lead to harm to persons.

### **Provision: 9.8.10.2.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of structural failure at the point of attachment of stairs, which could lead to an inability to support vertical building loads or lateral earth loads, which could lead to:

- structural failure of the stairs, or
- where the foundation wall encloses interior spaces, compromised integrity of elements supported or protected by foundations, which could lead to the ingress of moisture from the ground, which could lead to deterioration.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1, OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability of the excessive deflection of stairs or the failure of foundation walls at the point of stair attachment due to dead and live loads imposed by stairs and users, which could lead to:

- persons falling,
- persons falling in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of failure of the foundation wall at the point of stair attachment due to dead and live loads imposed by stairs and users, which could lead to concrete cracking, which could lead to:

- the ingress of moisture from the ground, or

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported or protected by foundations.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.8.10.3.(1)**

---

**Objective**

OS3

**Attributions**

[F21-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of the transfer of uplift loads from freezing soil to the underside of stairs, which could lead to the failure of the stairs, anchorage system or foundation wall, which could lead to treads becoming unlevel, which could lead to persons falling, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F21-OS2.1]

**Intent(s)**

*Intent 1.* To limit the probability of the transfer of uplift loads from freezing soil to the underside of stairs, which could lead to the failure of the stairs, anchorage system or foundation wall, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OH1

**Attributions**

[F21-OH1.1, OH1.2, OH1.3]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* Where the foundation wall encloses interior spaces, to limit the probability of the transfer of uplift loads from freezing soil to the underside of stairs, which could lead to the failure of the foundation wall at the point of stair attachment, which could lead to concrete or masonry cracking, which could lead to:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported or protected by foundations.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.9.1.1.(1)**

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.8. for requirements regarding stairways, handrails and guards in a means of egress.

*Intent 2.* To state the application of Section 9.9.

---

### **Provision: 9.9.1.2.(1)**

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.10. for requirements regarding flame-spread ratings, fire-resistance ratings and fire-protection ratings.

---

### **Provision: 9.9.1.3.(1)**

### **Objective**

OS3

### **Attributions**

[F10-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability of overcrowding, which could lead to delayed egress during emergency evacuation, which could lead to harm to persons.

*Intent 2.* To determine the minimum design occupant load in order to calculate exit capacity.

*Intent 3.* To expand the application of Article 3.1.17.1. to apply to Part 9 buildings.

**Provision: 9.9.1.3.(2)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of overcrowding, which could lead to delayed egress during emergency evacuation, which could lead to harm to persons.

*Intent 2.* To determine the minimum design occupant load in order to calculate exit capacity.

**Provision: 9.9.2.1.(1)**

---

**Intent(s)**

*Intent 1.* To clarify which types of egress facilities are permitted to be accepted as exits.

*Intent 2.* To clarify that, in cases of conflict, more specific requirements or limitations in this Section take precedence over this general statement.

**Provision: 9.9.2.1.(2)**

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 3.4.7. to include existing Part 9 buildings.

**Provision: 9.9.2.1.(3)**

---

**Intent(s)**

*Intent 1.* To expand the application of Sentence 3.4.1.6.(1) and Article 3.4.6.10. to include Part 9 buildings.

**Provision: 9.9.2.2.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7] Applies to "An *exit* shall be designed for no purpose other than for exiting ..."

**Intent(s)**

*Intent 1.* To limit the probability that the use of exits for a purpose other than exiting will lead to exits being obstructed or not readily available in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that the use of an exit for a purpose other than exiting will create a hazard in the exit, which could lead to harm to persons using the exit.

---

**Intent(s)**

*Intent 1.* To waive the prohibition in the first part of this Sentence on the use of exits for other purposes and allow them to serve as access to floor areas, on the basis that this use:

---

## **Intent Statements: NBC 2010**

- does not create injury hazards or risks of obstructions in exits, and
- does not compromise availability of the exits in an emergency.

---

### **Provision: 9.9.2.3.(1)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that an element of a means of egress from a building will have an inadequate capacity or a lower degree of safety than that required for the other elements, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency situation, which could lead to harm to persons.

*Intent 2.* To limit the probability that a person's unwillingness to use, or lack of familiarity with, an exit facility in an emergency situation will lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.2.4.(1)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will be impeded in their exit path of travel should they choose to use the most familiar egress route (the principal entrance door they likely came in through) in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.3.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.9.3.

*Intent 2.* To exempt certain situations from the application of Subsection 9.9.3., where there is a lower occupant load and where occupants are likely to have an enhanced familiarity with egress facilities.

---

### **Provision: 9.9.3.2.(1)**

#### **Objective**

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that exit facilities will be of insufficient width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.3.3.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that certain corridors will be of insufficient width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that certain corridors will be of insufficient width to permit the efficient circulation of persons travelling in opposite directions in a non-emergency situation, which could lead to persons bumping or hitting each other, which could lead to harm to persons.

*Intent 3.* To supersede and increase the minimum width of exit facilities specified in Sentence 9.9.3.2.(1).

---

### **Provision: 9.9.3.4.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of persons contacting or colliding with items at ceiling level, which could lead to harm to persons.

*Intent 2.* To limit the probability that exits and access to exits will have an insufficient ceiling height to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.3.4.(2)**

#### **Objective**

OS3

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of persons contacting or colliding with items at ceiling level, which could lead to harm to persons.

*Intent 2.* To limit the probability that exits and access to exits will have an insufficient ceiling height to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 3.* To supersede the requirement stated in Sentence (1) and permit a reduction in the minimum clear height of storeys in storage garages, on the basis that the occupant load is limited and most occupants are in vehicles.

### **Provision: 9.9.4.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.9.4.

*Intent 2.* To exempt certain situations from the application of Subsection 9.9.4., where there is a lower occupant load and where occupants are likely to have an enhanced familiarity with exit facilities.

### **Provision: 9.9.4.2.(1)**

---

#### **Objective**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that fire will spread from one floor area to another floor area by means of openings in exits, which could lead to damage to the building.

---

### **Provision: 9.9.4.2.(5)**

---

#### **Intent(s)**

*Intent 1.* To exempt some configurations of exterior exit passageways from the application of Sentences 9.9.4.2.(1) and 9.9.4.2.(2), which would otherwise require the passageway to be separated from floors areas by a fire separation or smoke-tight barrier, on the basis that it is not expected that smoke will accumulate in the passageway and exits are available at each end of the passageway.

---

### **Provision: 9.9.4.3.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Article 9.9.4.3.

*Intent 2.* To state the requirements for wired glass and glass block permitted by Sentence 9.9.4.2.(4) to be installed in fire separations that separate exits from the remainder of the building.

---

### **Provision: 9.9.4.3.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive glazing in certain doors and sidelights, which could lead to radiation exposure and excessively high temperatures in the area near the unexposed side of the door or sidelight during a fire, which could lead to the reluctance of persons to pass near the door or sidelight, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability of excessive glazing in certain doors and sidelights, which could lead to excessively high temperatures in the area near the unexposed side of the doors during a fire, which could lead to an unacceptable radiation exposure, which could lead to harm to persons.

*Intent 3.* To state the requirements for wired glass and glass block permitted by Sentence 9.9.4.2.(4) to be installed in fire separations that separate exits from the remainder of the building.

---

### **Provision: 9.9.4.3.(3)**

---

#### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.9.4.3.(2), which would otherwise limit the area of glazing, on the basis that the vestibule or corridor is expected to provide adequate radiation protection.

*Intent 2.* To state the requirements for wired glass and glass block permitted by Sentence 9.9.4.2.(4) to be installed in fire separations that separate exits from the remainder of the building.

**Provision: 9.9.4.4.(1)**

---

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a fire compartment, dwelling unit, ancillary space or common space in a house containing a secondary suite through unprotected openings in exterior building walls to an exterior exit stair or ramp, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To expand the application of Articles 9.10.13.5. and 9.10.13.7. to include wired glass and glass blocks in unprotected openings in exterior walls under certain conditions.

**Provision: 9.9.4.5.(1)**

---

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a fire compartment through openings in exterior building walls to an exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To expand the application of Articles 9.10.13.5. and 9.10.13.7. to include wired glass and glass blocks in openings in exterior walls under certain conditions.

**Provision: 9.9.4.6.(1)**

---

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread through unprotected openings in the exterior walls of a fire compartment, dwelling unit, ancillary space or common space in a house containing a secondary suite to an outside area near the exterior exit door of another fire compartment, dwelling unit, ancillary space or common space in a house containing a secondary suite, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To expand the application of Articles 9.10.13.5. and 9.10.13.7. to include wired glass and glass blocks in unprotected openings in exterior walls under certain conditions.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.9.4.7.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To supersede the requirements stated in Sentence 9.9.4.2.(1), which would otherwise require the stairway to be separated from floor areas, and in Sentence 9.10.1.3.(6), which would otherwise require an unenclosed stairway to conform to Subsection 3.2.8. for the protection of openings through floor assemblies, if certain conditions are met.

This is to limit the probability of delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.9.5.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.9.5.

*Intent 2.* To exempt situations from the application of Subsection 9.9.5., where there is a lower occupant load and where occupants are likely to have an enhanced familiarity with egress facilities.

### **Provision: 9.9.5.2.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that corridors will be of insufficient width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.9.5.3.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that a person with a visual disability will hit an obstruction in a corridor that cannot be detected by a cane, which could lead to harm to persons.

### **Provision: 9.9.5.3.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt an item projecting into a corridor from the dimensional limits of Sentence (1), on the basis that it can be detected by a cane.

**Provision: 9.9.5.4.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that obstructions in an exit will reduce the exit width, which could lead to insufficient exit width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.5.5.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that obstructions in a required means of egress will reduce the width of the means of egress to less than the required width, which could lead to insufficient width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.5.5.(2)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that the width of the required means of egress will be reduced to less than the required width, which could lead to insufficient width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.5.5.(3)**

---

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence (2), which would otherwise prohibit the placing of obstructions in means of egress, and permit such obstructions, on the basis that:

- the application is limited to certain occupancies and floor areas that are not generally accessible to the public, and
- persons on the floor area are likely to be familiar with egress facilities.

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that an explosion in a service room will spread to an exit, which could lead to harm to persons using the exit.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To limit the probability that an explosion in a service room will spread to an exit, which could lead to the exit not being usable in the emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.5.9.(1)**

#### **Objective**

OS1

#### **Attributions**

[F05, F06-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that a fire involving certain rooms will spread into an exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that a fire involving certain rooms will spread into an exit, which could lead to fire emergency response operations being delayed or ineffective, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that a malfunction of an appliance in certain rooms [causing the release of harmful fumes or gases, for example] will lead to hazardous conditions in exits, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency situation, which could lead to harm to persons.

---

### **Provision: 9.9.6.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Sentence 9.9.6.1.(2) and 9.9.6.1.(3).

---

### **Provision: 9.9.6.1.(2)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that doors and their jambs will protrude an excessive distance into the width of corridors and other facilities, which could lead to persons contacting or colliding with the protrusions, which could lead to harm to persons.

*Intent 2.* To limit the probability that doors and their jambs will protrude an excessive distance into the width of exits, which could lead to an insufficient exit width to permit efficient egress in an emergency

---

## **Intent Statements: NBC 2010**

situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To supersede the requirements of Sentence 9.9.3.2.(1) and Sentence 9.9.5.4.(1), which would otherwise prohibit obstructions in exits, and permit exit doors to cause a reduction in the width of exits, on the basis that the reduction in width is limited and should not negatively affect exit usage.

---

### **Provision: 9.9.6.1.(3)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that the swing of doors will substantially reduce the width of corridors and other facilities, which could lead to persons contacting or colliding with the protrusions, which could lead to harm to persons.

*Intent 2.* To limit the probability that the swing of doors will substantially reduce the width of exits, which could lead to an insufficient exit width to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To supersede the requirements of Sentence 9.9.5.4.(1), which would otherwise prohibit obstructions in exits, and permit doors to cause a reduction in the width of exits, on the basis that the reduction in width is limited and should not negatively affect exit usage.

---

### **Provision: 9.9.6.1.(4)**

#### **Intent(s)**

*Intent 1.* To exempt doors serving a single dwelling unit or a house with a secondary suite from the requirements of Sentences 9.9.6.1.(2) and 9.9.6.1.(3).

---

### **Provision: 9.9.6.2.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that doorways will be of insufficient height, which could lead to persons contacting or colliding with the top of the door frame, which could lead to harm to persons.

*Intent 2.* To limit the probability that doorways in exits will have insufficient headroom clearance to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To supersede the requirements of Sentence 9.9.3.4.(1), which would otherwise require a greater headroom clearance in exits, and permit a reduction, on the basis that the reduction is limited and should not negatively affect exit usage.

**Provision: 9.9.6.2.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of persons contacting or colliding with items at the ceiling level, which could lead to harm to persons.

*Intent 2.* To limit the probability that exits will have insufficient headroom clearance to permit efficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To supersede the requirements of Sentence 9.9.3.4.(1), which would otherwise require a greater headroom clearance in exits, and of Sentence 9.9.6.2.(1), which would otherwise require a greater height in doorways, and permit a reduction, on the basis that the reduction is limited and should not negatively affect exit usage.

**Provision: 9.9.6.2.(3)**

---

**Intent(s)**

*Intent 1.* To exempt doors serving a single dwelling unit or a house with a secondary suite from the requirements of Sentences 9.9.6.2.(1) and 9.9.6.2.(2).

**Provision: 9.9.6.3.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Sentences 9.9.6.3.(2) and 9.9.6.3.(3).

**Provision: 9.9.6.3.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that doorways will be of insufficient width, which could lead to persons contacting or colliding with elements in doorways, which could lead to harm to persons.

*Intent 2.* To limit the probability that doorways will be of insufficient width to permit efficient egress in an emergency situation, which could lead to congestion at the door openings, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.9.6.3.(3)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that doorways will be of insufficient width, which could lead to persons contacting or colliding with elements in doorways, which could lead to harm to persons.

*Intent 2.* To limit the probability that doorways will be of insufficient width to permit efficient egress in an emergency situation, which could lead to congestion at the door openings, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.9.6.3.(4)**

---

#### **Intent(s)**

*Intent 1.* To exempt doors serving a single dwelling unit or a house with a secondary suite from the requirements of Sentence 9.9.6.3.(2).

### **Provision: 9.9.6.4.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of delays in opening an exit door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.9.6.4.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will be unaware that a sliding door can be swung open, which could impede their travel to an exit location during an emergency, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.9.6.4.(3)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Article 3.4.6.15. to revolving doors in buildings to which Part 9 applies.

**Provision: 9.9.6.4.(4)**

---

**Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.9.6.4.(1) movable partitions that are between a public corridor and an adjacent occupancy, on the basis that there is an alternate means of egress available that does not pass through the location where the movable panels are used so occupants would not be impeded in their egress.

**Provision: 9.9.6.4.(5)**

---

**Intent(s)**

*Intent 1.* To exempt certain exit doors from the requirements of Sentence 9.9.6.4.(2) and Sentence 9.9.6.4.(3), which would otherwise require the doors to swing on the vertical axis and breakaway doors to be labeled, and permit doors not swinging on their vertical axis and the omission of labels, on the basis that such doors are limited to situations where:

- persons are most likely familiar with the door's operation, or
- there is minimal danger to life safety.

**Provision: 9.9.6.5.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of delays in opening an exit door that does not open in the direction of travel in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that an exit door that does not open in the direction of travel will be difficult to open in an emergency situation if several persons approach it at the same time and the pressure of the group prevents the first person from pulling the door towards them, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To limit the probability that a person having fallen in front of an exit door that does not open in the direction of travel in an emergency situation will obstruct the opening of the door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.6.5.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that the lack of a convention regarding the direction of door swing will lead to delays in opening an egress door that does not open in the direction of travel in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that an egress door that does not open in the direction of travel will be difficult to open in an emergency situation if several persons approach it at the same time and the pressure of the group prevents the first person from pulling the door towards them, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 3.* To limit the probability that a person falling in front of an egress door that does not open in the direction of travel in an emergency situation will obstruct the opening of the door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 4.* To limit the probability that a person will think the door is locked if it fails to open in the expected direction of travel in an emergency situation, which could lead to confusion, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 5.* To limit the probability that a person will be hit by a door swinging in an unfamiliar direction, which could lead to harm to persons.

---

### **Provision: 9.9.6.6.(1)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that a person on the step nearest the door will be hit by the door when it is opened, which could lead to harm to the person.

*Intent 2.* To limit the probability that a person stepping through the door and down onto a step will fall, which could lead to harm to the person.

*Intent 3.* To limit the probability that a person will step through the door and down onto a step in an emergency situation, which could lead to the person falling and obstructing other persons using the exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 4.* To limit the probability that there will not be enough space on the landing to stand while opening the door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.6.6.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To supersede the requirements in Sentence 9.9.6.6.(1), which prohibits exit doors to open directly onto a step, on the basis that a step of limited height will minimize the danger of door blockage from ice or snow without creating an undue risk of injury or delay.

This is to limit the probability that the accumulation of ice or snow outside the door will block the door, which could lead to persons being unable to leave the building in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.6.7.(1)**

#### **Objective**

OS3

#### **Attributions**

9.9.6.7.(1)(a) [F10-OS3.7]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of delays in opening doors in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

9.9.6.7.(1)(b) [F10, F81-OS3.7]

### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 3.4.6.16.(1), which would otherwise not permit the use of locking devices, and permit electromagnetic locks on exit doors if certain conditions are met.

This is to limit the probability that:

- exit doors will not be readily openable in an emergency situation,
- persons will be unable to release the locking mechanisms on exit doors in an emergency situation, and
- persons will not be familiar with procedures for unlocking exit doors in an emergency situation.

This is to limit the probability of delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To expand the application of Sentence 3.4.6.16.(4) to exit doors with electromagnetic locking mechanisms in Part 9 buildings.

---

## **Provision: 9.9.6.7.(2)**

### **Objective**

OS3

### **Attributions**

[F10-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that persons with physical disabilities will be unable to release a door requiring the use of both hands to operate more than one releasing device, which could lead to delays in opening the door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons will be delayed in operating the release hardware of the door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Provision: 9.9.6.7.(3)**

### **Objective**

OS3

### **Attributions**

[F10-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that the door release hardware will be located excessively high above the floor level, which could lead to persons being unable to easily reach the hardware in an emergency

situation, which could lead to delays in opening the door, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Objective**

OA1

**Attributions**

[F73-OA1]

**Intent(s)**

*Intent 1.* To limit the probability that the door release hardware will be located excessively high above the floor level, which could lead to persons with physical disabilities being unable to easily reach the hardware in an emergency situation, which could lead to delays in opening the door, which could lead to delays in evacuation or moving to a safe place, which could lead to harm to persons.

---

**Provision: 9.9.6.7.(4)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that a person leaving a suite in an emergency situation will be unable to return to the suite if they encounter untenable conditions in the egress routes because the door will have shut and lock itself behind them, which could lead to harm to persons.

---

**Provision: 9.9.6.8.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of delays in opening exit doors in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.9.7.1.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of delays in the evacuation or movement of persons to a safe place in an emergency, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To clarify that the access to exit provisions in Part 9 apply to roofs that are intended for occupancy, as well as to podiums, terraces, platforms and contained open spaces.

---

### **Provision: 9.9.7.1.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of delays in the evacuation or movement of persons to a safe place in the event that one of the means of egress becomes obstructed or inaccessible in an emergency, which could lead to harm to persons.

---

### **Provision: 9.9.7.1.(3)**

#### **Intent(s)**

*Intent 1.* To expand the application of Article 9.9.7.4. to include podiums, terraces, platforms and contained open spaces.

---

### **Provision: 9.9.7.2.(1)**

#### **Objective**

OS1

#### **Attributions**

[F10-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons leaving a suite in a fire situation will not be protected from fire from another fire compartment during their evacuation or movement to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.7.2.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will not have access to an alternative egress route in the event one route is blocked or obstructed in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.7.3.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that persons will enter an excessively long dead-end portion of a corridor during an emergency situation and be prevented from retracing their steps as a result of crowd pressure or untenable conditions, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To exempt dead-end corridors entirely within suites from the maximum 6-m length requirement stated in the second part of the Sentence, on the basis that the occupants are familiar with the suite arrangement and are expected to make appropriate decisions in an emergency.

*Intent 3.* To direct Code users to Sentence 9.9.9.2.(1) to which this requirement [length of dead-end corridors] is an exception.

**Provision: 9.9.7.4.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient number of egress doors from a large room or suite, which could lead to inefficient egress in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To exempt situations from the application of this Sentence, where there is a lower occupant load and where occupants are likely to have an enhanced familiarity with egress facilities.

**Provision: 9.9.7.4.(2)**

---

**Objective**

OS1

**Attributions**

[F10-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not have access to an alternative egress door and route in the event one door and route are blocked or obstructed in a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.9.7.5.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will need to rely on egressing through areas not under their control in an emergency situation, which could lead to:

- delays in the evacuation or movement of persons to a safe place, and
- egress into unsafe or hazardous areas.

This is to limit the probability of harm to persons.

### **Provision: 9.9.7.6.(1)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of the maximum travel distances stated in Article 9.9.8.2. [specifically Sentence 9.9.8.2.(1)] to include travel distances within rooms or suites.

*Intent 2.* To exempt situations from the application of this Sentence, where there is a lower occupant load and where occupants are likely to have an enhanced familiarity with egress facilities.

### **Provision: 9.9.8.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To define how to measure travel distance within a floor area for the location of exits or for the purposes of Subsection 9.9.8.

### **Provision: 9.9.8.1.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt travel distance measurements involving suites or rooms from the application of Sentence (1), which would otherwise require the measurements to be taken from the furthest point in the suites or rooms, and permit the measurements to be taken from the egress door of the suites or rooms, if certain conditions are met.

This is on the basis that:

- fire compartments provide temporary protection from fires occurring elsewhere in a building, and
- that in sprinklered buildings a fire is likely to be extinguished quickly and unrated enclosures provide a barrier to smoke.

### **Provision: 9.9.8.1.(3)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Subclauses 3.4.2.5.(1)(d)(i) to 3.4.2.5.(1)(d)(iv) to Part 9 buildings.

*Intent 2.* To exempt travel distance measurements involving wide public corridors from the application of Sentences 9.9.8.1.(1) and 9.9.8.2.(1), and permit a longer maximum travel distance if certain conditions are met [i.e. conformance to Subclauses 3.4.2.5.(1)(d)(i) to 3.4.2.5.(1)(d)(iv)], on the basis that, in sprinklered buildings, wide corridors that are sufficiently high will allow for a reasonable volume of smoke storage above the heads of the pedestrians.

---

**Provision: 9.9.8.2.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability of excessive travel distances to exits, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons will not have access to an alternative exit in the event one exit is blocked or obstructed in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.9.8.2.(2)**

---

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence (1), which would otherwise require at least 2 egress routes or exits, and permit a single exit, on the basis that the single exit is limited to low buildings having a relatively low occupant load and where floor areas and travel distances are limited.

---

**Provision: 9.9.8.3.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that an excessive portion of the required exiting capacity will be concentrated at one location, which could lead to insufficient width in other exits to permit efficient egress in an emergency situation if the exit becomes obstructed or inaccessible, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.9.8.4.(1)**

---

**Objective**

OS1

**Attributions**

[F10-OS1.5]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that persons will not have access to an alternative exit in the event one exit is blocked or obstructed in a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.8.5.(1)**

#### **Objective**

OS1

#### **Attributions**

[F10-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that a fire that has spread into a lobby from an adjacent floor area will lead to untenable conditions in the exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the requirements of Sentence 9.9.4.2.(1), which would otherwise require the exit to be separated from adjacent floor areas by a fire separation having a minimum fire-resistance rating.

---

### **Provision: 9.9.8.5.(2)**

#### **Objective**

OS1

#### **Attributions**

[F10-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that excessive travel distances through the lobby or excessively long flights of exit stairs will delay evacuation in a fire situation, which could lead to harm to persons.

---

### **Provision: 9.9.8.5.(3)**

#### **Objective**

OS1

#### **Attributions**

[F10-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that a fire will spread into the lobby from an adjacent occupancy, which could lead to untenable conditions in the exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To permit certain types of rooms having a low fire hazard to open onto exit lobbies.

---

### **Provision: 9.9.8.5.(4)**

#### **Objective**

OS1

#### **Attributions**

[F10-OS1.5]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentences 9.9.8.5.(3) and 9.9.4.2.(1) by waiving the requirement for the fire separation to have a fire-resistance rating, if certain conditions are met [i.e. lobby and adjacent occupancies are sprinklered].

This is to limit the probability that a fire will spread into the lobby from an adjacent occupancy, which could lead to untenable conditions in the exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.9.8.5.(5)**

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that fire or smoke will spread into the lobby from an elevator shaft, which could lead to untenable conditions in the exit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the application of Sentence 9.9.8.5.(3) by allowing elevator doors to open onto certain lobbies, on condition that elevator doors remain normally closed, which should provide adequate separation in the event of a fire.

---

**Provision: 9.9.8.6.(1)**

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that egress routes from a mezzanine will become untenable in a fire situation during the time involved in reaching the exits accessible at mezzanine level, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To clarify that mezzanines are to be provided with exits on the same basis as required for floor areas.

*Intent 3.* To expand the application of Subsection 9.9.8. to mezzanines that are not included in the definition of floor area.

---

**Provision: 9.9.8.6.(2)**

**Intent(s)**

*Intent 1.* To exempt exits serving certain mezzanines from the application of Sentence 9.9.8.6.(1), which would otherwise require exits on the same basis as required for floor areas, on the basis that the mezzanines are relatively small and have a limited occupant load and travel distance, thus allowing occupants to safely evacuate through the main floor level of the storey containing the mezzanine.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.9.8.6.(3)**

---

#### **Intent(s)**

*Intent 1.* To exempt one of the means of egress serving mezzanines from the application of Sentence 9.9.8.6.(1), which would otherwise require exits on the same basis as required for floor areas, and permit one of the means of egress to lead through the room in which the mezzanine is located if certain conditions are met.

This is to limit the probability of delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.8.6.(4)**

---

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive travel distances to an exit in the event of a fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.9.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive travel distances to reach a level served by an egress door or exit doorway in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the requirements of Sentences 9.9.8.2.(1) and 9.9.8.2.(2), which would otherwise impose other travel distance or exit limitations.

---

### **Provision: 9.9.9.1.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.9.9.1.(1), which would otherwise limit the travel distance to 1 storey to reach an exit or egress door, and permit a travel distance of more than 1 storey, if the floor level is served by a window meeting certain conditions that limit the probability that persons will be unable to egress from the floor level through the window in an emergency situation, which

could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the requirements of Sentences 9.9.8.2.(1) and 9.9.8.2.(2), which would otherwise impose other travel distance or exit limitations.

---

**Provision: 9.9.9.1.(3)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.9.9.1.(1), which would otherwise limit the travel distance to 1 storey to reach an exit or egress door, and permit a travel distance of more than 1 storey, on the basis that the floor level is served by a balcony, which can be used to provide a safe refuge area in an emergency situation.

This is to limit the probability of delays in evacuation or moving to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the requirements of Sentences 9.9.9.1.(1) and 9.9.9.1.(2), which would otherwise impose other travel distance or exit limitations.

---

**Provision: 9.9.9.2.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not have access to an alternative egress route in the event one route is blocked or obstructed in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.9.9.3.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not have access to an alternative egress route in the event one route is blocked or obstructed in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the requirements of Sentence 9.9.7.2.(1), which would otherwise permit a single exit or doorway from a suite.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.9.9.3.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons will not have access to an alternative egress route in the event one route is blocked or obstructed in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To supersede the requirements of Sentence 9.9.7.2.(1), which would otherwise permit a single exit or doorway from a suite.

### **Provision: 9.9.10.1.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that, in an emergency, all means of egress will be blocked, which could lead to persons being trapped in a bedroom, which could lead to harm to persons.

### **Provision: 9.9.10.1.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that, in an emergency, designated escape windows will be too small to be used as an alternate means of escape and will not remain open without the need for additional support, which could lead to persons being trapped in a bedroom, which could lead to harm to persons.

### **Provision: 9.9.10.1.(3)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that, in an emergency, inadequate clearance between the designated escape window and the facing wall of the window well will lead to persons being trapped in a bedroom, which could lead to harm to persons.

**Provision: 9.9.10.1.(4)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that operation of a window sash will reduce the required clearance from a window well to a designated escape window, which could lead to persons being trapped in a bedroom in an emergency, which could lead to harm to persons.

**Provision: 9.9.10.1.(5)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that, in an emergency, all means of egress will be blocked, which could lead to persons being trapped in a bedroom, which could lead to harm to persons.

**Provision: 9.9.11.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.9.11.

*Intent 2.* To exempt certain situations from the application of Subsection 9.9.11., where occupants are likely to have an enhanced familiarity with the location of exit facilities.

**Provision: 9.9.11.2.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not be familiar with the location of exits, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency situation, which could lead to harm to persons.

**Provision: 9.9.11.3.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that exit locations will not be readily identified, which could lead to delays in the evacuation or movement of persons to a safe place in an emergency situation, which could lead to harm to persons.

---

### **Provision: 9.9.11.3.(2)**

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that exit signs will not be seen or readily recognized under normal conditions, which could lead to exit locations not being readily identified in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.11.3.(3)**

#### **Objective**

OS3

#### **Attributions**

[F10, F81-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that internally illuminated exit signs will not operate properly [e.g. due to normal power failure], which could lead to the exit signs not being illuminated in an emergency situation, which could lead to exit locations not being readily identified, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.11.3.(4)**

#### **Objective**

OS3

#### **Attributions**

[F10, F81-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that externally illuminated exit signs will not operate properly [e.g. due to normal power failure], which could lead to the exit signs not being illuminated in an emergency situation, which could lead to exit locations not being readily identified, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.11.3.(5)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that electrical circuits for the illumination of exit signs will not operate properly [e.g. due to normal power failure, or will fail or be disconnected due to deficiencies with other non-emergency electrical equipment], which could lead to the exit signs not being illuminated in an emergency situation, which could lead to exit locations not being readily identified, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Intent(s)**

*Intent 1.* To direct Code users to Sentences 9.9.12.3.(2), 9.9.12.3.(3) and 9.9.12.3.(7).

**Provision: 9.9.11.3.(6)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not be familiar with the direction of egress routes, which could lead to exit locations not being readily identified in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To expand the application of Clauses 9.9.11.3.(2)(b) and 9.9.11.3.(2)(c) to signs indicating the direction of egress, which would otherwise only apply to exit signs.

**Provision: 9.9.11.4.(1)**

---

**Objective**

OS3

**Attributions**

[F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that persons using an exit ramp or stair in an emergency situation will continue past the lowest exit level, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.9.11.5.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons using exits will not be familiar with assigned floor numbers, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that a person with a visual impairment [or disability] will be unable to determine the floor number by reason of being unable to reach raised numbers and feel them, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

#### **Objective**

OA1

#### **Attributions**

[F73-OA1]

#### **Intent(s)**

*Intent 1.* To limit the probability that persons with a visual impairment [or disability] using exits will not be familiar with assigned floor numbers, which could lead to the persons not being able to circulate within a building without the assistance of another person.

### **Provision: 9.9.12.1.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.9.12.

*Intent 2.* To exempt certain situations from the application of Subsection 9.9.12., where occupants are likely to have an enhanced familiarity with the location of exit facilities.

### **Provision: 9.9.12.2.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

#### **Intent(s)**

*Intent 1.* To limit the probability that egress routes and exits will have inadequate illumination, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that egress routes and exits will have inadequate illumination in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.12.2.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that egress routes and exits will have no illumination, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that egress routes and exits will have no illumination, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.12.3.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that exits, egress routes and certain areas will not be illuminated when there is a loss of normal power, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that exits, egress routes and certain areas will not be illuminated when there is a loss of normal power in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.12.3.(2)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.9.12.3.(3)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.12.3.(4)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.12.3.(5)**

#### **Objective**

OS3

#### **Attributions**

[F30-OS3.1] [F10-OS3.7]

### **Intent(s)**

*Intent 1.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that certain areas in buildings will have inadequate illumination when there is a loss of normal power in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.9.12.3.(6)**

### **Intent(s)**

*Intent 1.* To provide a simple method of determining the capacity of incandescent lighting fixtures and clarify that it is deemed to provide equivalent illumination to that required by Sentence 9.9.12.3.(4).

**Provision: 9.9.12.3.(7)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] [F10-OS3.7]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of self-contained emergency lighting units will fall significantly below expectations, which could lead to such devices not performing in the way intended when there is a loss of normal power, which could lead to certain areas in buildings having inadequate illumination, which could lead to safety hazards [bumping, tripping, falling, etc.], which could lead to harm to persons.

*Intent 2.* To limit the probability that the performance of self-contained emergency lighting units will fall significantly below expectations, which could lead to such devices not performing in the way intended when there is a loss of normal power in an emergency situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the conditions under which roof assemblies must be considered as exterior walls for the purposes of the application of Section 9.10.

This is based on the potential radiation hazard of nearly-vertical roofs which, under fire conditions, could radiate sufficient heat to ignite nearly-parallel surfaces of adjacent buildings.

**Provision: 9.10.1.2.(1)**

---

**Objective**

OS1

**Attributions**

[F02, F81, F82-OS1.2, OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that integrated life safety and fire protection systems will not meet proper standards, which could lead to such systems not performing in the way intended in a fire situation, which could lead to an inadequate water supply to fire suppression systems or a fire not being suppressed or controlled, which could lead to the spread of fire to other parts of the building, which could lead to harm to persons.

*Intent 2.* To limit the probability that the integrated life safety and fire protection systems will not perform as originally intended in a fire situation, which could lead to persons not being promptly notified of the fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F02, F81, F82-OP1.2]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that integrated life safety and fire protection systems will not meet proper standards, which could lead to such systems not performing in the way intended in a fire situation, which could lead to an inadequate water supply to fire suppression systems or a fire not being suppressed or controlled, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

---

### **Provision: 9.10.1.3.(1)**

### **Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to tents, air-supported structures, transformer vaults, walkways, elevators and escalators to Part 9 buildings.

---

### **Provision: 9.10.1.3.(2)**

### **Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to rooms or spaces intended for an assembly occupancy to Part 9 buildings.

---

### **Provision: 9.10.1.3.(3)**

### **Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to large basements to Part 9 buildings.

---

### **Provision: 9.10.1.3.(4)**

### **Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to rooms or spaces that are intended for the storage, manufacture or use of hazardous or explosive material to Part 9 buildings.

---

### **Provision: 9.10.1.3.(5)**

### **Objective**

OS1

### **Attributions**

[F01-OS1.1] Applies to portion of Code text: "... facilities for the dispensing of fuel shall not be installed in any *building*."

### **Intent(s)**

*Intent 1.* To limit the probability that vapours will migrate into other areas of a building, which could lead to the accumulation of the vapours in sufficient quantity to form an ignitable mixture, which could lead to the ignition of the vapours from a nearby ignition source, which could lead to harm to persons.

*Intent 2.* To limit the probability that vapours will accumulate in sufficient quantity to form an ignitable mixture, which could lead to the ignition of the vapours from a nearby ignition source, which could lead to harm to persons.

---

**Intent(s)**

*Intent 1.* To expand the application of Article 3.3.5.8. pertaining to facilities for the dispensing of fuel having a flash point below 37.8°C to Part 9 buildings.

**Provision: 9.10.1.3.(6)**

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 3.2.8. pertaining to the protection of mezzanines and openings through floor assemblies to Part 9 buildings.

*Intent 2.* To exempt openings through floor assemblies conforming to Subsection 3.2.8. from the requirements of Sentence 9.10.12.1.(1).

**Provision: 9.10.1.3.(7)**

---

**Intent(s)**

*Intent 1.* To expand the application of Subsection 3.6.3. pertaining to vertical service spaces and facilities to Part 9 buildings.

**Provision: 9.10.1.3.(8)**

---

**Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to the design, construction and installation of sprinkler systems to Part 9 buildings.

**Provision: 9.10.1.3.(9)**

---

**Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to the design, construction and installation of standpipe and hose systems to Part 9 buildings.

**Provision: 9.10.1.3.(10)**

---

**Intent(s)**

*Intent 1.* To expand the application of Part 3 provisions pertaining to the installation of fire pumps to Part 9 buildings.

**Provision: 9.10.1.3.(11)**

---

**Intent(s)**

*Intent 1.* To expand the application of Article 3.6.1.4. pertaining to fuel-fired appliances to Part 9 buildings.

**Provision: 9.10.1.4.(1)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To expand the application of Article 6.2.2.7. pertaining to commercial cooking equipment to Part 9 buildings.

---

### **Provision: 9.10.2.1.(1)**

#### **Intent(s)**

*Intent 1.* To classify buildings or portions of buildings based on use and occupancy in order to determine appropriate requirements in the Code.

---

### **Provision: 9.10.2.2.(1)**

#### **Intent(s)**

*Intent 1.* To classify certain convalescent homes and children's custodial homes as residential occupancies if they are limited in size and number of occupants, and to exempt such buildings from the Part 3 Group B classification, as required in Sentence 9.10.2.1.(1).

This is to determine appropriate requirements in the Code.

---

### **Provision: 9.10.2.3.(1)**

#### **Intent(s)**

*Intent 1.* To clarify that the requirements of Article 9.10.8.1. [pertaining to the minimum fire-resistance ratings of floors and roofs] for each portion of a building containing a major occupancy are to be applied to that portion as if the entire building were of that major occupancy.

---

### **Provision: 9.10.2.4.(1)**

#### **Intent(s)**

*Intent 1.* To exempt buildings containing certain major occupancies from the application of Sentence 9.10.2.3.(1), which might otherwise impose more onerous requirements relating to the fire-resistance ratings of floors and roofs, on the basis that such occupancies do not occupy a significant portion of the floor area.

---

### **Provision: 9.10.3.1.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Sentences 3.1.7.1.(1) and 3.1.8.4.(1) to Part 9 buildings.

*Intent 2.* To exempt building elements from the application of Sentences 3.1.7.1.(1) and 3.1.8.4.(1), on the basis that the ratings assigned in A-9.10.3.1. in Appendix A as well as those in Appendix D are considered equivalent to the ratings assigned by the test methods stated in Sentences 3.1.7.1.(1) and 3.1.8.4.(1).

---

### **Provision: 9.10.3.2.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Sentences 3.1.12.1.(1) and 3.1.12.1.(2) to Part 9 buildings.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To exempt building elements from the application of Sentences 3.1.12.1.(1) and 3.1.12.1.(2), on the basis that the ratings assigned in Appendix D are considered equivalent to the ratings assigned by the test methods stated in Sentences 3.1.12.1.(1) and 3.1.12.1.(2).

**Provision: 9.10.3.2.(2)**

---

**Intent(s)**

*Intent 1.* To clarify the use of the term flame-spread rating for the purposes of Section 9.10.

**Provision: 9.10.3.3.(1)**

---

**Intent(s)**

*Intent 1.* To clarify that the fire-resistance rating of certain assemblies is determined by exposing the underside of the assemblies to fire, which is expected to represent the most severe exposure condition.

**Provision: 9.10.3.3.(2)**

---

**Intent(s)**

*Intent 1.* To clarify that the fire-resistance rating for exterior wall assemblies is determined by exposing the assemblies to fire from inside the building, which is expected to represent the most severe exposure condition.

**Intent(s)**

*Intent 1.* To exempt exterior walls from the temperature rise limitations required by the standard tests referred to in Article 9.10.3.1. if certain conditions are met [such walls have a limiting distance of not less than 1.2 m] and due allowance is made for the effects of heat radiation [e.g. Sentence 3.2.3.1.(9)] so as to limit the probability that fire will spread from one building to an adjacent building.

*Intent 2.* To expand the application of Sentence 3.2.3.1.(9) to Part 9 buildings.

**Provision: 9.10.3.3.(3)**

---

**Intent(s)**

*Intent 1.* To clarify that the fire-resistance rating of certain wall assemblies is determined by exposing both sides of the assembly to fire.

**Provision: 9.10.3.4.(1)**

---

**Objective**

OS1

**Attributions**

[F04-OS1.3]

**Intent(s)**

*Intent 1.* To limit the probability that buoyant, hot gases generated during a fire will lift lay-in panels or tiles, which could lead to the spread of fire into the ceiling space, which could lead to the premature failure or collapse of the ceiling structure, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

[F04-OP1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that buoyant, hot gases generated during a fire will lift lay-in panels or tiles, which could lead to the spread of fire into the ceiling space, which could lead to the premature failure or collapse of the ceiling structure, which could lead to damage to the building.

**Provision: 9.10.4.1.(1)**

---

### **Intent(s)**

*Intent 1.* To exempt mezzanines from the calculation of building height, if certain conditions are met that limit the size of mezzanines, on the basis that this configuration does not pose an undue fire safety risk to persons.

**Provision: 9.10.4.1.(2)**

---

### **Intent(s)**

*Intent 1.* To exempt mezzanines from the calculation of building height, if certain conditions are met that limit the size of the mezzanines and their degree of visual obstruction, on the basis that this configuration does not pose an undue fire safety risk to persons.

**Provision: 9.10.4.1.(3)**

---

### **Intent(s)**

*Intent 1.* To exempt an enclosed space above a mezzanine from the requirements of Clause 9.10.4.1.(2)(b), if certain conditions are met that limit the size and location of the enclosed space on the mezzanine, on the basis that this configuration does not pose an undue safety risk to persons.

**Provision: 9.10.4.1.(4)**

---

### **Intent(s)**

*Intent 1.* To clarify that mezzanines that are not considered as storeys are nonetheless considered part of the floor area of the storey in which they are located because they impact on the occupant and fire loads for that storey.

**Provision: 9.10.4.1.(5)**

---

### **Intent(s)**

*Intent 1.* To exempt from the requirements of Sentences 9.10.4.1.(1) to Sentence 9.10.4.1.(4) platforms intended solely for periodic inspection and maintenance that are not used for storage and are constructed with noncombustible materials, because they have no impact on the occupant and fire loads of the storey in which they are located.

**Provision: 9.10.4.2.(1)**

---

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentences 9.10.4.1.(1) to Sentence 9.10.4.1.(4), which would otherwise exempt mezzanines from the calculation of building height, and require that each level of mezzanine additional to the first level be considered as a storey in calculating building height to account for the greater travel distance and time needed to evacuate upper-level mezzanines.

**Provision: 9.10.4.3.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To allow a basement storage garage to be considered as a separate building from the portion above if certain measures are taken.

These measures are to limit the probability that fire will spread from the garage to the upper portions of the building during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons in the upper portions of the building.

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To allow a basement storage garage to be considered as a separate building from the portion above if certain measures are taken.

These measures are to limit the probability that fire will spread from the garage to the upper portions of the building, which could lead to damage to the building.

**Provision: 9.10.4.4.(1)**

---

**Intent(s)**

*Intent 1.* To exclude certain rooftop enclosures from the calculation of building height, on the basis that such enclosures are normally only briefly and intermittently occupied by persons and thus do not pose an undue fire safety risk to persons.

**Provision: 9.10.5.1.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2] [F04-OS1.3]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that openings in rated wall or ceiling membranes will contribute to the spread of fire within the wall or ceiling space, which could lead to the premature failure or collapse of the wall or ceiling assembly, which could lead to harm to persons.

*Intent 2.* To limit the probability that openings in rated wall or ceiling membranes will contribute to the spread of fire within the wall or ceiling space, which could lead to the premature failure or collapse of the wall or ceiling assembly, which could lead to the spread of fire from one compartment to another, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2] [F04-OP1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that openings in rated wall or ceiling membranes will contribute to the spread of fire within the wall or ceiling space, which could lead to the premature failure or collapse of the wall or ceiling assembly, which could lead to damage to the building.

*Intent 2.* To limit the probability that openings in rated wall or ceiling membranes will contribute to the spread of fire within the wall or ceiling space, which could lead to the premature failure or collapse of the wall or ceiling assembly, which could lead to the spread of fire from one compartment to another, which could lead to damage to the building.

---

## **Provision: 9.10.5.1.(2)**

---

### **Objective**

OS1

### **Attributions**

[F04-OS1.3]

### **Intent(s)**

*Intent 1.* To exempt openings for electrical and similar service outlet boxes from the requirements of Sentence 9.10.5.1.(1), which would otherwise not permit openings in rated wall or ceiling membranes, if certain conditions are met [i.e. the outlet boxes are tightly fitted].

This is to limit the probability that the openings will contribute to the spread of fire within the wall or ceiling space, which could lead to the premature failure or collapse of the wall or ceiling assembly, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F04-OP1.3]

### **Intent(s)**

*Intent 1.* To exempt openings for electrical and similar service outlet boxes from the requirements of Sentence 9.10.5.1.(1), which would otherwise not permit openings in rated wall or ceiling membranes, if certain conditions are met [such outlet boxes are tightly fitted].

This is to limit the probability that the openings will contribute to the spread of fire within the wall or ceiling space, which could lead to the premature failure or collapse of the wall or ceiling assembly, which could lead to damage to the building.

**Provision: 9.10.5.1.(3)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that certain service equipment penetrating wall assemblies that also form a fire separation will contribute to the spread of fire through the assemblies, which could lead to a loss of integrity of the fire separation, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to harm to persons in the other compartment.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that certain service equipment penetrating wall assemblies that also form a fire separation will contribute to the spread of fire through the assemblies, which could lead to a loss of integrity of the fire separation, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to damage to the building in the other compartment.

**Provision: 9.10.5.1.(4)**

---

**Objective**

OS1

**Attributions**

[F04-OS1.2, OS1.3]

**Intent(s)**

*Intent 1.* To exempt openings leading to ducts from the requirements of Sentence 9.10.5.1.(1), which would otherwise not permit openings in rated ceiling membranes, if certain conditions are met [i.e. the ducts, the amount of openings and their protection conform to the requirements of Appendix D].

This is to limit the probability that openings into rated ceiling membranes will contribute to the spread of fire within the ceiling space, which could lead to the premature failure or collapse of the structure within the ceiling space, which could lead to harm to persons.

*Intent 2.* To make the provisions in Appendix D mandatory with respect to:

- area, size, spacing and support of openings,
- materials, clearance to ceiling membrane and support for ducts, and
- thermal protection and fire stop flaps for ducts.

---

**Objective**

OP1

**Attributions**

[F04-OP1.3]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To exempt openings leading to ducts from the requirements of Sentence 9.10.5.1.(1), which would otherwise not permit openings in rated ceiling membranes, if certain conditions are met [i.e. the ducts, the amount of openings and their protection conform to the requirements of Appendix D].

This is to limit the probability that openings into rated ceiling membranes will contribute to the spread of fire within the ceiling space, which could lead to the premature failure or collapse of the structure within the ceiling space, which could lead to damage to the building.

*Intent 2.* To make the provisions in Appendix D mandatory with respect to:

- area, size, spacing and support of openings,
- materials, clearance to ceiling membrane and support for ducts, and
- thermal protection and fire stop flaps for ducts.

---

### **Provision: 9.10.6.1.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Subsection 3.1.5. to Part 9 buildings.

*Intent 2.* To define what constitutes noncombustible construction and to describe the construction materials that shall be used in order to limit the probability that they will contribute to the growth and spread of fire.

---

### **Provision: 9.10.6.2.(1)**

#### **Intent(s)**

*Intent 1.* To clarify how to assign fire-resistance ratings to heavy timber construction in Part 9.

*Intent 2.* To expand the application of Article 3.1.4.7. to Part 9 buildings.

---

### **Provision: 9.10.7.1.(1)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2] [F04-OS1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that structural steel members will fail prematurely when exposed to fire, which could lead to the failure or collapse of rated construction supported by the structural steel members [e.g. floor, roof and wall assemblies] during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons.

*Intent 2.* To limit the probability that structural steel members will fail prematurely when exposed to fire, which could lead to the failure or collapse of rated construction supported by the structural steel members [e.g. floor, roof and wall assemblies], which could lead to the spread of fire from a lower storey of a building to an upper storey during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2] [F04-OP1.3]

**Intent(s)**

*Intent 1.* To limit the probability that structural steel members will fail prematurely when exposed to fire, which could lead to the failure or collapse of rated construction supported by the structural steel members [e.g. floor, roof and wall assemblies], which could lead to damage to the building.

*Intent 2.* To limit the probability that structural steel members will fail prematurely when exposed to fire, which could lead to the failure or collapse of rated construction supported by the structural steel members [e.g. floor, roof and wall assemblies], which could lead to the spread of fire from a lower storey of a building to an upper storey, which could lead to damage to the building.

---

**Provision: 9.10.8.1.(1)****Objective**

OS1

**Attributions**

[F03-OS1.2] [F04-OS1.2, OS1.3] Applies to portion of Code text: "Except as otherwise provided in this Subsection, the *fire-resistance ratings* of floors and roofs shall conform to Table 9.10.8.1."

**Intent(s)**

*Intent 1.* To limit the probability that floors and roofs exposed to fire will fail or collapse prematurely during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons.

*Intent 2.* To limit the probability that floors and roofs exposed to fire will fail or collapse prematurely, which could lead to the spread of fire from a lower storey of a building to an upper storey or to the exterior of the building during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2] [F04-OP1.2, OP1.3] Applies to portion of Code text: "Except as otherwise provided in this Subsection, the *fire-resistance ratings* of floors and roofs shall conform to Table 9.10.8.1."

**Intent(s)**

*Intent 1.* To limit the probability that floors and roofs exposed to fire will fail or collapse prematurely, which could lead to damage to the building.

*Intent 2.* To limit the probability that floors and roofs exposed to fire will fail or collapse prematurely, which could lead to the spread of fire from a lower storey of a building to an upper storey or to the exterior, which could lead to damage to the building.

---

**Provision: 9.10.8.2.(1)****Objective**

OS1

**Attributions**

9.10.8.2.(1)(a), 9.10.8.2.(1)(b) [F02, F82-OS1.3] [F13-OS1.5, OS1.2]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To exempt roof assemblies from the requirements of Sentence 9.10.8.1.(1), which would otherwise require roof assemblies to have a minimum fire-resistance rating, if certain conditions are met [i.e. the building is sprinklered and the sprinkler system meets certain operational conditions].

This is to limit the probability that:

- a fire will not be controlled or suppressed, which could lead to exposure of the roof assembly to fire, which could lead to the premature failure or collapse of the roof assembly,
- deficiencies in the sprinkler system will go unnoticed, which could lead to the sprinkler system not operating properly in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to exposure of the roof assembly to fire, which could lead to the premature failure or collapse of the roof assembly, or
- delays in notification of the fire department will occur, which could lead to fire emergency response operations being delayed, which could lead to
  - delays in the evacuation or movement of persons to a safe place, or
  - the spread of fire to other parts of the building.

This is to limit the probability of harm to persons.

*Intent 2.* To expand the application of Sentences 9.10.8.1.(1) and 3.2.4.10.(3) to Part 9 buildings.

---

### **Objective**

OP1

### **Attributions**

9.10.8.2.(1)(a), 9.10.8.2.(1)(b) [F02, F82-OP1.3] [F13-OP1.2]

### **Intent(s)**

*Intent 1.* To exempt roof assemblies from the requirements of Sentence 9.10.8.1.(1), which would otherwise require the roof assemblies to have a minimum fire-resistance rating, if certain conditions are met [i.e. the building is sprinklered and the sprinkler system meets certain operational conditions].

This is to limit the probability that:

- a fire will not be controlled or suppressed, which could lead to exposure of the roof assembly to fire, which could lead to the premature failure or collapse of the roof assembly,
- deficiencies in the sprinkler system will go unnoticed, which could lead to the sprinkler system not operating properly in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to exposure of the roof assembly to fire, which could lead to the premature failure or collapse of the roof assembly, or
- delays in notification of the fire department will occur, which could lead to fire emergency response operations being delayed, which could lead to the spread of fire to other parts of the building.

This is to limit the probability of damage to the building.

*Intent 2.* To expand the application of Sentences 9.10.8.1.(1). and 3.2.4.10.(3) to Part 9 buildings.

---

[F04-OP1.2, OP1.3]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that light-frame construction walls, columns, arches, beams and loadbearing steel elements exposed to fire will fail or collapse prematurely, which could lead to the failure or collapse of the floor or roof assembly, which could lead to damage to the building.

*Intent 2.* To limit the probability that light-frame construction walls, columns, arches, beams and loadbearing steel elements exposed to fire will fail or collapse prematurely, which could lead to the failure or collapse of the floor or roof assembly above, which could lead to the spread of fire from a lower storey of a building to an upper storey or to the exterior, which could lead to damage to the building.

---

### **Provision: 9.10.8.4.(1)**

#### **Objective**

OS1

#### **Attributions**

[F04-OS1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that supporting structures will be burnt away in a fire, which could lead to insufficient fire resistance, which could lead to the collapse of the structures and their supported assemblies, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F04-OP1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that supporting structures will be burnt away in a fire, which could lead to insufficient fire resistance, which could lead to the collapse of the structures and their supported assemblies, which could lead to damage to the building.

---

### **Provision: 9.10.8.5.(1)**

#### **Intent(s)**

*Intent 1.* To exempt structures supporting certain rooms or spaces from the application of Sentence 9.10.8.3.(1), on the basis that the collapse of such rooms and spaces, which are not normally occupied, do not pose a hazard to persons.

---

### **Provision: 9.10.8.6.(1)**

#### **Intent(s)**

*Intent 1.* To clarify the application of Table 9.10.8.1. for requirements pertaining to the construction of certain mezzanine floor assemblies.

**Provision: 9.10.8.7.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from an area or space below a portion of a roof supporting an occupancy to the roof during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons on the roof.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from an area or space below a portion of a roof supporting an occupancy to the roof, which could lead to damage to the building.

**Provision: 9.10.8.8.(1)**

---

**Objective**

OS1

**Attributions**

[F05-OS1.5] [F06-OS1.5, OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that floor assemblies of exterior passageways that are used as part of a means of egress will fail or collapse prematurely when exposed to fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that floor assemblies of exterior passageways that are used as part of a means of egress will fail or collapse prematurely when exposed to fire, which could lead to delays or ineffectiveness in emergency response operations, which could lead to:

- delays in the evacuation or movement of persons to a safe place, or
- the spread of fire to other parts of the building.

This is to limit the probability of harm to persons.

---

**Objective**

OP1

**Attributions**

[F04-OP1.3] [F06-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that floor assemblies of exterior passageways that are used as part of a means of egress will fail or collapse prematurely when exposed to fire, which could lead to damage to the building.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To limit the probability that floor assemblies of exterior passageways that are used as part of a means of egress will fail or collapse prematurely when exposed to fire, which could lead to delays or ineffectiveness in emergency response operations, which could lead to the further spread of fire, which could lead to damage to the building.

---

### **Provision: 9.10.8.8.(2)**

#### **Intent(s)**

*Intent 1.* To exempt exterior passageways serving certain buildings from the requirements of Sentence 9.10.8.8.(1), which would otherwise require the passageway floors to have a minimum fire-resistance rating, on the basis that the buildings are limited in height, travel distances from the space are short, the occupants are not expected to be sleeping, and evacuation is expected to be relatively quick.

---

### **Provision: 9.10.8.8.(3)**

#### **Intent(s)**

*Intent 1.* To exempt exterior passageways serving a single dwelling unit or a house with a secondary suite from the requirements of Sentence 9.10.8.8.(1), which would otherwise require the passageway floors to have a minimum fire-resistance rating, on the basis that occupant load is low, travel distances from the space are short, and evacuation from the dwelling unit or suite is expected to be relatively quick.

---

### **Provision: 9.10.8.9.(1)**

#### **Intent(s)**

*Intent 1.* To expand the application of Sentence 9.10.8.1.(1) to certain crawl spaces, on the basis that such crawl spaces have increased potential to be the source of a fire.

---

### **Provision: 9.10.8.10.(1)**

#### **Intent(s)**

*Intent 1.* To limit the application of Article 9.10.8.1. by excluding certain dwelling units and houses with a secondary suite.

*Intent 2.* To exempt certain dwelling units and houses with secondary suites from the requirements of Sentence 9.10.8.1.(1), which would otherwise require a minimum fire-resistance rating for floor and roof assemblies, on the basis that:

- the vertical spread of fire from one unit or occupancy to another is not possible, and
- for houses containing a secondary suite:
  - the construction of rated fire separations may be cost-prohibitive, and
  - the reduction in protection from spread of fire is off-set by more stringent requirements for notification of occupants.

---

### **Provision: 9.10.8.11.(1)**

#### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To exempt assemblies that conform to Section 3.2. from the requirements of Sentences 9.10.8.1.(1) and 9.10.8.3.(1).

---

### **Provision: 9.10.9.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.10.9.

---

### **Provision: 9.10.9.2.(1)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire separations will have insufficient resistance to the spread of fire and smoke through assemblies and where the fire separations abut against another assembly, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire separations will have insufficient resistance to the spread of fire and smoke through assemblies and where the fire separations abut against another assembly, which could lead to damage to the building.

---

### **Provision: 9.10.9.2.(2)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that smoke-tight barriers will have insufficient resistance to the spread of smoke through assemblies and where the smoke-tight barriers abut another assembly, which could lead to harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from one fire compartment to another fire compartment or that smoke will spread from one dwelling unit or space, to another dwelling unit or space in a house with a secondary suite through gaps where the fire separation or smoke-tight barrier abuts other assemblies, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from one fire compartment to another fire compartment or that smoke will spread from one dwelling unit, to another dwelling unit in a house with a secondary suite through gaps where the fire separation or smoke-tight barrier abuts other assemblies, which could lead to damage to the building.

---

## **Provision: 9.10.9.2.(4)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that smoke will spread through gypsum board joints and penetrations from one dwelling unit or space to another dwelling unit or space in a house with a secondary suite, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that smoke will spread through gypsum board joints and penetrations from one dwelling unit or space to another dwelling unit or space in a house with a secondary suite, which could lead to damage to the building.

---

## **Provision: 9.10.9.3.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To exempt openings in fire separations from the application of Sentence 9.10.9.2.(1), if certain measures are taken to limit the probability that fire will spread through such openings, which could lead to harm to persons in the area on the other side of the separation.

*Intent 2.* To direct Code users to Subsection 9.10.13. for the requirements regarding closures in fire separations.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To exempt openings in fire separations from the application of Sentence 9.10.9.2.(1), if certain measures are taken to limit the probability that fire will spread through such openings, which could lead to damage to the building on the other side of the separation.

*Intent 2.* To direct Code users to Subsection 9.10.13. for the requirements regarding closures in fire separations.

---

**Provision: 9.10.9.3.(2)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To exempt openings in smoke-tight barriers from the application of Sentence 9.10.9.2.(2), if certain measures are taken to limit the probability that smoke will spread through such openings, which could lead to harm to persons in the area on the other side of the separation.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To exempt openings in smoke-tight barriers from the application of Sentence 9.10.9.2.(2), if certain measures are taken to limit the probability that smoke will spread through such openings, which could lead to damage to the building.

---

**Provision: 9.10.9.4.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a lower storey of a building to an upper storey during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons in the upper storey.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a lower storey of a building to an upper storey, which could lead to damage to the building.

---

### **Provision: 9.10.9.4.(2)**

---

### **Intent(s)**

*Intent 1.* To exempt floor assemblies that are contained within dwelling units or houses with secondary suites from the requirements of Sentence 9.10.9.4.(1), which would otherwise require the assemblies to be fire separations, on the basis that occupants are expected to be familiar with their space and should be able to evacuate relatively quickly.

---

### **Provision: 9.10.9.4.(3)**

---

### **Intent(s)**

*Intent 1.* To exempt certain mezzanine floors and floor assemblies from the requirements of Sentence 9.10.9.4.(1), which would otherwise require the floors to be fire separations, on the basis that such floors are limited in size or number of storeys [e.g. floors above crawl spaces, floors of exterior passageways], and are not considered to be exposed to substantial fire hazards.

---

### **Provision: 9.10.9.4.(4)**

---

### **Intent(s)**

*Intent 1.* To exempt floors above certain crawl spaces from the requirements of Sentence 9.10.9.4.(1), which would otherwise require the floors to be fire separations, on the basis that the height of the crawl space is limited and the crawl space is not used as an occupancy or as a plenum, and thus the crawl space is not expected to present an undue fire risk.

---

### **Provision: 9.10.9.5.(1)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 3.2.8. to Part 9 buildings.

*Intent 2.* To exempt openings through floor assemblies conforming to Subsection 3.2.8. from the requirements of Sentence 9.10.12.1.(1).

---

### **Provision: 9.10.9.6.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that openings in fire separations, made by the penetration of various types of service equipment, will not be sealed or tightly fitted, which could lead to a loss of integrity of the fire separations, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to harm to persons in the other compartment.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.9.6.(3)**

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2] [F04-OP1.3] Applies to portion of Code text: “Except as provided in Sentences 9.10.9.6.(4) to 9.10.9.6.(12) and Article 9.10.9.7., pipes, ducts, electrical boxes, totally enclosed raceways or other similar service equipment that partly or wholly penetrate an assembly required to have a *fire-resistance rating* shall be *noncombustible*...”

#### **Intent(s)**

*Intent 1.* To limit the probability that certain service equipment that penetrates fire-rated assemblies will contribute to the growth and spread of fire within the assemblies, which could lead to the structural failure and collapse of the assemblies, which could lead to damage to the building.

*Intent 2.* To limit the probability that certain service equipment that penetrates fire-rated assemblies that also form a fire separation will contribute to the growth and spread of fire within the assemblies, which could lead to a loss of integrity of the assemblies, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to damage to the building in the other compartment.

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2] [F04-OS1.3] Applies to portion of Code text: “ Except as provided in Sentences 9.10.9.6.(4) to 9.10.9.6.(12) and Article 9.10.9.7., pipes, ducts, electrical boxes, totally enclosed raceways or other similar service equipment that partly or wholly penetrate an assembly required to have a *fire-resistance rating* shall be *noncombustible*...”

#### **Intent(s)**

*Intent 1.* To limit the probability that certain service equipment that penetrates fire-rated assemblies will contribute to the growth and spread of fire within the assemblies, which could lead to the structural failure and collapse of the assemblies, which could lead to harm to persons.

*Intent 2.* To limit the probability that certain service equipment that penetrates fire-rated assemblies that also form a fire separation will contribute to the growth and spread of fire within or through the assemblies, which could lead to a loss of integrity of the fire separation, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to harm to persons in the other compartment.

---

#### **Intent(s)**

*Intent 1.* To exempt service equipment from having to be noncombustible if certain testing is conducted on the assemblies with the equipment installed, on the basis that the testing demonstrates that combustible service equipment will not reduce the structural integrity of the assembly in a fire.

### **Provision: 9.10.9.6.(4)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain service equipment from the requirements of Sentence 9.10.9.6.(3), on the basis that the equipment is deemed to not contribute significantly to the growth and spread of fire.

**Provision: 9.10.9.6.(5)**

---

**Intent(s)**

*Intent 1.* To exempt certain service equipment from the application of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the equipment is deemed to not contribute significantly to the growth and spread of fire.

**Provision: 9.10.9.6.(6)**

---

**Intent(s)**

*Intent 1.* To exempt certain service equipment from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the equipment is deemed to not contribute significantly to the growth and spread of fire.

**Provision: 9.10.9.6.(7)**

---

**Intent(s)**

*Intent 1.* To exempt combustible totally enclosed raceways from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the raceways are protected by a concrete covering and should not contribute significantly to the growth and spread of fire.

**Provision: 9.10.9.6.(8)**

---

**Intent(s)**

*Intent 1.* To exempt combustible outlet boxes from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the equipment is deemed to not contribute significantly to the growth and spread of fire.

**Provision: 9.10.9.6.(9)**

---

**Intent(s)**

*Intent 1.* To exempt certain piping from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the piping is deemed to not contribute significantly to the growth and spread of fire.

*Intent 2.* To expand the application of Sentence 3.1.9.4.(4) to Part 9 buildings.

**Provision: 9.10.9.6.(10)**

---

**Intent(s)**

*Intent 1.* To exempt certain piping from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that such conditions will control the growth and spread of fire.

**Provision: 9.10.9.6.(11)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To exempt penetrations made by sprinklers through rated assemblies from the requirements of Sentence 9.10.9.6.(1), which would otherwise require the penetration to be tightly fitted or fire stopped, if certain conditions are met, on the basis that the application of the fire stop material may render the sprinklers ineffective.

---

### **Intent(s)**

*Intent 1.* To exempt sprinklers that penetrate a fire separation or membrane from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the sprinkler is deemed to not contribute significantly to the growth and spread of fire.

---

### **Provision: 9.10.9.6.(12)**

---

### **Intent(s)**

*Intent 1.* To exempt certain piping from the requirements of Sentence 9.10.9.6.(3) if certain conditions are met, on the basis that the piping is deemed to not contribute significantly to the growth and spread of fire.

*Intent 2.* To expand the application of Sentences 9.10.9.7.(2) to 9.10.9.7.(6) to combustible piping for central vacuum systems penetrating fire separations.

---

### **Provision: 9.10.9.6.(13)**

---

### **Intent(s)**

*Intent 1.* To exempt penetrations made by fire dampers through rated assemblies from the requirements of Sentence 9.10.9.6.(1), which would otherwise require the penetration to be tightly fitted or fire stopped, if certain conditions are met, on the basis that the application of the fire stop material may render the dampers ineffective.

---

### **Provision: 9.10.9.7.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2] [F04-OS1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that combustible piping penetrating rated assemblies will contribute to the growth and spread of fire within the assemblies, which could lead to the structural failure and collapse of the assemblies, which could lead to harm to persons.

*Intent 2.* To limit the probability that combustible piping penetrating rated fire separations will contribute to the growth and spread of fire within the fire separations, which could lead to a loss of integrity of the fire separations, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to harm to persons in the other compartment.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2] [F04-OP1.3]

**Intent(s)**

*Intent 1.* To limit the probability that combustible piping penetrating rated assemblies will contribute to the growth and spread of fire within the assemblies, which could lead to the structural failure and collapse of the assemblies, which could lead to damage to the building.

*Intent 2.* To limit the probability that combustible piping penetrating rated fire separations will contribute to the growth and spread of fire within the fire separations, which could lead to a loss of integrity of the fire separations, which could lead to the spread of fire and smoke from one fire compartment to another, which could lead to damage to the building.

**Provision: 9.10.9.7.(2)**

---

**Intent(s)**

*Intent 1.* To exempt certain combustible piping from the requirements of Sentence 9.10.9.7.(1) if certain conditions are met, on the basis that the imposed conditions limit the probability of the spread of fire and smoke.

**Provision: 9.10.9.7.(3)**

---

**Intent(s)**

*Intent 1.* To state the test method to be used for testing fire stop systems.

**Provision: 9.10.9.7.(4)**

---

**Intent(s)**

*Intent 1.* To exempt combustible drain piping from the requirements of Sentence 9.10.9.7.(1) if certain conditions are met, on the basis that the imposed conditions limit the probability of the spread of fire and smoke.

**Provision: 9.10.9.7.(5)**

---

**Intent(s)**

*Intent 1.* To exempt certain combustible piping from the requirements of Sentence 9.10.9.7.(1) if certain conditions are met, on the basis that the imposed conditions limit the probability of the spread of fire and smoke.

**Provision: 9.10.9.7.(6)**

---

**Intent(s)**

*Intent 1.* To exempt certain combustible piping from the requirements of Sentence 9.10.9.7.(1) if certain conditions are met, on the basis that the imposed conditions limit the probability of the spread of fire and smoke.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.9.8.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that the collapse of combustible construction when exposed to fire will lead to the collapse of the fire separation, which could lead to the spread of fire from one fire compartment to an adjacent compartment, which could lead to harm to persons in the adjacent compartment.

---

#### **Objective**

[F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability of premature failure and loss of airtightness of the air barrier system, which could lead to the migration of gas and fumes from the garage into a dwelling unit, which could lead to the accumulation of gas and fumes to levels that pose a risk to human health from long-term exposure, which could lead to harm to persons.

---

## **Provision: 9.10.9.18.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that smoke from a fire in one compartment will spread to another compartment by means of the exhaust ducts, which could lead to harm to persons in the other compartment.

---

## **Provision: 9.10.9.18.(2)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that pressure from such fans will overload the exhaust fan required at or near the exhaust outlet, which could lead to the build-up of a positive pressure in the shared exhaust

duct, which could lead to smoke from a fire in one compartment being spread to another compartment, which could lead to harm to persons in the other compartment.

**Provision: 9.10.9.19.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that burning or smouldering debris ingested by a vacuum system will be transported across a fire separation to a collection point, which could lead to a fire in another fire compartment, which could lead to harm to persons in the other compartment.

**Provision: 9.10.10.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.10.10.

**Provision: 9.10.10.2.(1)**

---

**Intent(s)**

*Intent 1.* To exempt floor assemblies that are immediately below service rooms from the fire-resistance rating requirements in Subsection 9.10.10. [specifically Sentences 9.10.10.3.(1), 9.10.10.4.(1) and 9.10.10.5.(1)], on the basis that the condition being guarded against is a fire originating in the service room and that floor assemblies are only rated for fire originating below them.

**Provision: 9.10.10.3.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2] [F03, F81-OS1.4]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a service room to other parts of the building, which could lead to harm to persons in the other parts of the building.

*Intent 2.* To limit the probability that a fire originating in a location outside a service room will spread into the service room, which could lead to the disruption and discontinuation of service from equipment located in the service room, which could lead to an undue fire hazard in the building, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a service room to other parts of the building, which could lead to damage to the building.

*Intent 2.* To limit the probability that a fire originating in a location outside a service room will spread into the service room, which could lead to the disruption and discontinuation of service from equipment located in the service room, which could lead to an undue fire hazard in the building, which could lead to damage to the building.

---

### **Provision: 9.10.10.3.(2)**

### **Intent(s)**

*Intent 1.* To exempt a service room containing equipment that does not constitute a fire hazard from the requirements of Sentence 9.10.10.3.(1), which would otherwise require the service room to be separated from the remainder of the building, on the basis that the risk of fire originating and spreading from the service room is minimized.

---

### **Provision: 9.10.10.4.(1)**

### **Objective**

OS1

### **Attributions**

[F03-OS1.2] [F03, F81-OS1.4]

### **Intent(s)**

*Intent 1.* To limit the probability that a fire involving a fuel-fired appliance in a service room will spread from the service room to other parts of the building, which could lead to harm to persons.

*Intent 2.* To limit the probability that a fire originating in a location outside a service room will spread into the service room, which could lead to the disruption and discontinuation of service from equipment located in the service room, which could lead to an undue fire hazard in the building, which could lead to harm to persons.

*Intent 3.* To supersede the requirements of Sentence 9.10.10.3.(1).

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2] [F03, F81-OP1.4]

### **Intent(s)**

*Intent 1.* To limit the probability that a fire involving a fuel-fired appliance in a service room will spread from the service room to other parts of the building, which could lead to damage to the building.

*Intent 2.* To limit the probability that a fire originating in a location outside a service room will spread into the service room, which could lead to the disruption and discontinuation of service from equipment located in the service room, which could lead to an undue fire hazard in the building, which could lead to damage to the building.

*Intent 3.* To supersede the requirements of Sentence 9.10.10.3.(1).

---

### **Provision: 9.10.10.4.(2)**

---

**Intent(s)**

*Intent 1.* To exempt certain fuel-fired appliances from the requirements of Sentence 9.10.10.4.(1), which would otherwise require the appliances to be located in a room separated from the remainder of the building by a fire separation, on the basis that the appliances serve a limited number of rooms or a small building.

**Provision: 9.10.10.4.(3)**

---

**Intent(s)**

*Intent 1.* To clarify that the requirements of Sentence 9.10.10.4.(1) do not apply to fireplaces and cooking appliances.

**Provision: 9.10.10.5.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2] [F03, F81-OS1.4]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.10.3.(1), which would otherwise require a minimum 1 h fire separation, and require a higher minimum rated separation, on the basis that incinerators pose a higher risk of fire or explosion.

*Intent 2.* To limit the probability that fire will spread from a service room containing an incinerator to other parts of the building, which could lead to harm to persons in the other parts of the building.

*Intent 3.* To limit the probability that a fire originating in a location outside a service room containing an incinerator will spread into the service room, which could lead to the disruption and discontinuation of service from equipment located in the service room, which could lead to an undue fire hazard in the building, which could lead to harm to persons.

### **Provision: 9.10.10.5.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of indoor incinerators, with respect to design, construction, installation and alteration, will fall significantly below expectations, which could lead to the spread of fire from inside the incinerator to other parts of the building, which could lead to harm to persons.

### **Provision: 9.10.10.5.(3)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate materials or design, faulty construction or poor installation practices will lead to excessive radiant heat loss, failure at joints or burn-through, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

*Intent 2.* To direct Code users to Section 9.21.

---

#### **Objective**

OH1

#### **Attributions**

[F40, F61-OH1.1, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate materials or design, faulty construction or poor installation practices will lead to:

- pollutant ingress, or
- water ingress and accumulation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To direct Code users to Section 9.21.

---

---

## **Provision: 9.10.11.2.(3)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that a party wall will not be continuous, which could lead to gaps or openings in the party wall during a fire, which could lead to the spread of fire from one building to another, which could lead to harm to persons in the building not originally involved in the fire.

---

### **Objective**

OP3

### **Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that a party wall will not be continuous, which could lead to gaps or openings in the party wall during a fire, which could lead to the spread of fire from the building to an adjacent building, which could lead to damage to the adjacent building.

**Provision: 9.10.11.2.(4)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread through spaces between the top of a party wall and a roof deck, which could lead to the spread of fire into the roof deck from one building to another, which could lead to harm to persons in the building not originally involved in the fire.

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread through spaces between the top of a party wall and a roof deck, which could lead to the spread of fire into the roof deck from the building to an adjacent building, which could lead to damage to the adjacent building.

**Provision: 9.10.11.3.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of provisions pertaining to firewalls in Part 3 to Part 9 buildings.

**Provision: 9.10.12.1.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from:

- a lower floor level to upper floor levels, or
- a floor area into exit stairs.

This is to limit the probability of:

- delays or ineffectiveness in fire suppression operations, which could lead to the spread of fire, and
- delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.12.3.(3)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To supersede the requirement for a rated fire separation of exterior walls as stated in Sentence 9.10.12.3.(2) and not require a fire-resistance rating if a 12.7 mm gypsum board is installed on the interior face of exterior walls of each dwelling unit or space referred to in Sentence (1) within the 1.2 m distance.

*Intent 2.* To limit the probability that fire or smoke will spread from one dwelling unit or space in a house with a secondary suite to another dwelling unit or space through exterior walls, which could lead to harm to persons in the other dwelling unit or space.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To supersede the requirement for a rated fire separation of exterior walls as stated in Sentence 9.10.12.3.(2) and not require a fire-resistance rating if a 12.7 mm gypsum board is installed on the interior face of exterior walls of each dwelling unit or space referred to in Sentence (1) within the 1.2 m distance.

*Intent 2.* To limit the probability that fire or smoke will spread from one dwelling unit or space in a house with a secondary suite to another dwelling unit or space through exterior walls, which could lead to damage to the building.

### **Provision: 9.10.12.4.(1)**

---

#### **Intent(s)**

*Intent 1.* To state the application of Article 9.10.12.4.

### **Provision: 9.10.12.4.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a suite through openings [e.g. windows or doors] in the exterior wall and then through openings in soffits, which could lead to the spread of fire through the common attic or roof space or the floor above to other suites, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a suite through openings [e.g. windows or doors] in the exterior wall and then through openings in soffits, which could lead to the spread of fire through the common attic or roof space or the floor above to other suites, which could lead to damage to the building or facility.

**Provision: 9.10.12.4.(3)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a suite through openings [e.g. windows or doors] in the exterior wall and then through openings in soffits, which could lead to the spread of fire through the common attic or roof space or the floor above to other suites, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a suite through openings [e.g. windows or doors] in the exterior wall and then through openings in soffits, which could lead to the spread of fire through the common attic or roof space or the floor above to other suites, which could lead to damage to the building.

**Provision: 9.10.12.4.(4)**

---

**Intent(s)**

*Intent 1.* To exempt portions of soffits or other surfaces that enclose a projection from the requirements of Sentence 9.10.12.4.(2), if certain measures are taken [i.e. the soffits or other surfaces are completely separated from the remainder of the attic or roof space by fire blocks], on the basis that the spread of fire to the attic or roof space is controlled by the fire blocks.

**Provision: 9.10.12.4.(5)**

---

**Intent(s)**

*Intent 1.* To exempt portions of soffits or other surfaces that enclose a projection from the requirements of Sentence 9.10.12.4.(2), if certain measures are taken [i.e. the suites and rooms are sprinklered as

---

## **Intent Statements: NBC 2010**

described], on the basis that the spread of fire to the attic or roof space is controlled by the automatic sprinkler system.

---

### **Provision: 9.10.13.1.(1)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread through openings in a fire separation, which could lead to harm to persons in the area on the other side of the separation.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread through openings in a fire separation, which could lead to damage to the building on the other side of the separation.

---

### **Provision: 9.10.13.2.(1)**

#### **Intent(s)**

*Intent 1.* To exempt certain door assemblies from the requirements of Sentence 9.10.13.1.(1), which would otherwise require testing to determine the fire-protection rating, on the basis that:

- such doors are constructed in a manner that has been shown to provide the required 20 min fire performance, and
- the fire load represented by the doors and their frames is limited, and there is no structural consequence of their eventual failure.

---

### **Provision: 9.10.13.2.(2)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To supersede the clearances stated in NFPA 80, which is referred to in Sentence 9.10.13.1.(1), in order to limit the probability that fire will spread through gaps between a door and its frame, which could lead to harm to persons in the area on the other side of the fire compartment.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To supersede the clearances stated in NFPA 80, which is referred to in Sentence 9.10.13.1.(1), in order to limit the probability that fire will spread through gaps between a door and its frame, which could lead to damage to the building on the other side of the fire compartment.

---

**Provision: 9.10.13.3.(1)**

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.13.1.(1), which would otherwise require the frames to be tested and rated, if certain conditions are met [i.e. wood frames have a minimum thickness], on the basis that the frames will provide an inherent and sufficient degree of resistance to the spread of fire.

---

**Provision: 9.10.13.4.(1)**

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.9.6. for requirements for doors in a means of egress.

---

**Provision: 9.10.13.5.(1)**

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentences 9.10.3.1.(1) and 9.13.1.1.(1), which would otherwise require the wired glass to be tested and meet certain minimum fire-protection ratings in accordance with certain standards, if certain conditions are met, on the basis that they [the conditions] provide an acceptable level of protection against the spread of fire.

*Intent 2.* To direct Code users to Sentence 9.6.1.2.(1).

*Intent 3.* To state the application of Sentence 9.10.13.5.(2).

---

**Provision: 9.10.13.5.(2)**

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that wired glass will be displaced from its mounting under the stresses imposed by a fire, which could lead to the spread of fire through openings in a fire separation, which could lead to harm to persons in the area on the other side of the separation.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that wired glass will be displaced from its mounting under the stresses imposed by a fire, which could lead to the spread of fire through openings in a fire separation, which could lead to damage to the building on the other side of the separation.

---

### **Provision: 9.10.13.5.(3)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that wired glass assemblies with a large area will fail prematurely when exposed to fire, which could lead to the spread of fire through openings in a fire separation, which could lead to harm to persons in the area on the other side of the separation.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that wired glass assemblies with a large area will fail prematurely when exposed to fire, which could lead to the spread of fire through openings in a fire separation, which could lead to damage to the building on the other side of the separation.

---

### **Provision: 9.10.13.6.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of steel door frames, when exposed to fire, will fall significantly below expectations, which could lead to the spread of fire through openings in a fire separation, which could lead to harm to persons in the area on the other side of the separation.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of steel door frames, when exposed to fire, will fall significantly below expectations, which could lead to the spread of fire through openings in a fire separation, which could lead to damage to the building on the other side of the separation.

**Provision: 9.10.13.7.(1)**

---

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentences 9.10.3.1.(1) and 9.13.1.1.(1), which would otherwise require the glass block to be tested and to meet certain minimum fire-protection ratings in accordance with certain standards, on the basis that the glass block [which is otherwise required to be installed in conformance with Section 9.20.] provides an acceptable level of protection against the spread of fire, in situations where the fire separation is required to have a fire-resistance rating of not more than 1 h.

**Provision: 9.10.13.8.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that large closures, which are permitted to have a lower fire resistance than the fire separations in which they are installed, will reduce the fire-resistance rating of the separations, which could lead to the spread of fire from one fire compartment to another, which could lead to harm to persons in the other fire compartment.

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that large closures, which are permitted to have a lower fire resistance than the fire separations in which they are installed, will reduce the fire-resistance rating of the separations, which could lead to the spread of fire from one fire compartment to another, which could lead to damage to the building in the other fire compartment.

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that pressure exerted during a fire will force a door open, which could lead to the spread of fire from one fire compartment to another, which could lead to harm to persons in the other fire compartment.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that pressure exerted during a fire will force a door open, which could lead to the spread of fire from one fire compartment to another, which could lead to damage to the building in the other fire compartment.

---

## **Provision: 9.10.13.10.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that a door will be left open during a fire, thus allowing fire to spread from one fire compartment to another, which could lead to harm to persons in the other fire compartment.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that a door will be left open during a fire, thus allowing fire to spread from one fire compartment to another, which could lead to damage to the building in the other fire compartment.

**Provision: 9.10.13.10.(2)**

---

**Intent(s)**

*Intent 1.* To exempt certain doors from the requirements of Sentence 9.10.13.10.(1), which would otherwise require automatic self-closing devices, on the basis that the conditions are such as to not present an undue hazard.

**Provision: 9.10.13.11.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Article 3.1.8.12. to Part 9 buildings.

**Provision: 9.10.13.12.(1)**

---

**Objective**

OS3

**Attributions**

[F30-OS3.1] Applies to portion of Code text: "Swing-type doors shall open into *service rooms* containing fuel-fired equipment where such doors lead to *public corridors* or rooms used for assembly ..."

**Intent(s)**

*Intent 1.* To limit the probability that a door swinging outwards will hit persons or lead to persons bumping into the door, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F10-OS1.5] Applies to portion of Code text: "... but shall swing outward from such rooms in all other cases."

**Intent(s)**

*Intent 1.* To limit the probability of delays in opening an egress door that does not open in the direction of travel in a fire or explosion situation, which could lead to delays in the evacuation or movement of persons in the service room to a safe place, which could lead to harm to persons in the service room.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.13.13.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from one fire compartment to another fire compartment through openings in a fire separation, which could lead to harm to persons in the other fire compartment.

*Intent 2.* To expand the application of Articles 3.1.8.4. and 3.1.8.9. to Part 9 buildings.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from one fire compartment to another fire compartment through openings in a fire separation, which could lead to damage to the other fire compartment.

*Intent 2.* To expand the application of Articles 3.1.8.4. and 3.1.8.9. to Part 9 buildings.

### **Provision: 9.10.13.13.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain branch ducts from the requirements of Sentence 9.10.13.13.(1), which would otherwise require fire dampers to be installed, on the basis that:

- the ducts are small,
- the ducts are capable of withstanding high temperatures,
- it is unlikely that hot gases will contact combustible building components, and
- the lack of dampers in this case will not contribute significantly to the spread of fire.

### **Provision: 9.10.13.13.(3)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain branch ducts from the requirements of Sentence 9.10.13.13.(1), which would otherwise require fire dampers to be installed, on the basis that:

- the ducts are capable of withstanding high temperatures,
- it is unlikely that hot gases will contact combustible building components, and
- the lack of dampers in this case will not contribute significantly to the spread of fire.

### **Provision: 9.10.13.13.(4)**

---

#### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To exempt certain ducts from the requirements of Sentence 9.10.13.13.(1), which would otherwise require fire dampers to be installed, on the basis that:

- the ducts are capable of withstanding high temperatures,
- it is unlikely that hot gases will contact combustible building components, and
- the lack of dampers in this case will not contribute significantly to the spread of fire.

---

### **Provision: 9.10.13.13.(5)**

#### **Intent(s)**

*Intent 1.* To exempt certain ducts from the requirements of Sentence 9.10.13.13.(1), which would otherwise require fire dampers to be installed, on the basis that:

- the lack of dampers in this case will not contribute significantly to the spread of fire,
- accidental closing of the dampers by the cooking operations would cause an undue hardship to the operations, and
- the fire dampers and their operating parts could collect grease, be very difficult to clean, and add to the fire hazard.

---

### **Provision: 9.10.13.14.(1)**

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread through openings in rated ceiling membranes, which could lead to the premature failure or collapse of the structure within the ceiling space, which could lead to harm to persons.

*Intent 2.* To make Appendix D, Fire Performance Ratings, mandatory with regard to the construction of fire stop flaps.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread through openings in rated ceiling membranes, which could lead to the premature failure or collapse of the structure within the ceiling space, which could lead to damage to the building.

*Intent 2.* To make Appendix D, Fire Performance Ratings, mandatory with regard to the construction of fire stop flaps.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.13.15.(1)**

---

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that fumes or vapours will migrate from the garage into the dwelling unit, which could lead to the accumulation of such fumes or vapours to levels that could pose a risk to human health from short-term exposure, which could lead to harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fumes or vapours will migrate from the garage into the dwelling unit, which could lead to the accumulation of such fumes or vapours, which could lead to their ignition by a nearby ignition source, which could lead to a fire or explosion, which could lead to harm to persons.

### **Provision: 9.10.13.15.(2)**

---

#### **Objective**

OS3

#### **Attributions**

[F44-OS3.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that fumes or vapours will migrate from the garage into a sleeping room, which could lead to the accumulation of such fumes vapours to levels that could pose a risk to human health from short-term exposure, which could lead to harm to persons.

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fumes or vapours will migrate from the garage into a sleeping room, which could lead to the accumulation of such fumes or vapours, which could lead to their ignition by a nearby ignition source, which could lead to a fire or explosion, which could lead to harm to persons.

---

**Provision: 9.10.13.16.(1)**

**Objective**

OS1

**Attributions**

[F81-OS1.4]

**Intent(s)**

*Intent 1.* To limit the probability that an unrestricted door swing will damage a fire separation, which could lead to the spread of fire from one compartment to another, which could lead to harm to persons in the other fire compartment.

---

**Objective**

OP1

**Attributions**

[F81-OP1.4]

**Intent(s)**

*Intent 1.* To limit the probability that an unrestricted door swing will damage a fire separation, which could lead to the spread of fire from one compartment to another, which could lead to damage to the building in the other fire compartment.

---

**Provision: 9.10.14.1.(1)**

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.10.14.

---

**Provision: 9.10.14.2.(1)**

**Intent(s)**

*Intent 1.* To state how to calculate the area of an exposing building face.

---

**Provision: 9.10.14.2.(2)**

**Intent(s)**

*Intent 1.* To clarify how the location of the exposing building face is determined in Subsection 9.10.14., for the purpose of determining the maximum area of unprotected openings permitted in irregularly shaped or skewed exterior walls.

---

**Provision: 9.10.14.2.(3)**

**Intent(s)**

*Intent 1.* To clarify how the location of the exposing building face and maximum area of unprotected openings is determined in Subsection 9.10.14., for the purpose of determining the type of construction and cladding and the minimum fire-resistance rating for irregularly shaped or skewed exterior walls.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.10.14.3.(1)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To redefine limiting distance as being less than actual in cases where the time from receipt of notification of a fire by the fire department until the first fire department vehicle arrives at the building is longer than assumed for the application of requirements based on limiting distance, and where protection is not provided by sprinklers.

This is to limit the probability that fire will spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.14.4.(1)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To expand the application of Subsection 3.2.3. to Part 9 buildings.

---

### **Provision: 9.10.14.4.(2)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building to an adjacent building through unprotected openings, which could lead to damage to the adjacent building.

*Intent 2.* To limit the probability that closures will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.14.4.(3)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a building that is close to the property line to an adjacent building through concentrations of unprotected opening areas during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

**Provision: 9.10.14.4.(4)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from a building that is close to the property line to an adjacent building through closely spaced unprotected openings during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

**Provision: 9.10.14.4.(5)**

---

**Intent(s)**

*Intent 1.* To define the configuration of a single room or space for the determination of minimum spacing requirements of unprotected openings in exposing building faces

**Provision: 9.10.14.4.(6)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.14.4.(1), which would otherwise require certain maximum areas of unprotected openings, and permit a doubling of unprotected openings if certain conditions are met [i.e. the unprotected openings are glazed with wired glass in steel frames or glass blocks as described in Articles 9.10.13.5. and 9.10.13.7.].

This is to limit the probability that fire will spread from the subject building to an adjacent building through unprotected openings during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To expand the application of Article 9.10.13.5. and 9.10.13.7. to wired glass and glass block in exposing building faces.

**Provision: 9.10.14.4.(7)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To supersede the requirements of Sentence 9.10.14.4.(1), which would otherwise require certain maximum areas of unprotected openings, and permit a doubling of unprotected openings if certain conditions are met [i.e. the building and certain rooms are sprinklered].

This is to limit the probability that a fire in the subject building will not be suppressed or controlled, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To supersede the requirements of the standards referenced in Article 3.2.5.12. by requiring certain rooms to be sprinklered.

---

### **Provision: 9.10.14.4.(8)**

#### **Intent(s)**

*Intent 1.* To exempt open-air storage garages from the requirements of Sentence 9.10.14.4.(1), which would otherwise limit the area of unprotected openings, and permit unlimited unprotected openings, on the basis that the fire load of the contents is relatively low, the space is well ventilated and the limiting distance is not less than 3 m.

---

### **Provision: 9.10.14.4.(9)**

#### **Intent(s)**

*Intent 1.* To exempt certain exposing building faces from the requirements of Sentence 9.10.14.4.(1), which would otherwise limit the area of unprotected openings, and permit unlimited unprotected openings, on the basis that the building face is readily accessible to firefighters [who will be able to effectively carry out fire suppression operations] and the limiting distance is not less than 9 m.

---

### **Provision: 9.10.14.4.(10)**

#### **Intent(s)**

*Intent 1.* To direct Code users to Sentence 9.10.14.4.(1).

*Intent 2.* To clarify that the requirements for unprotected openings in Article 9.10.14.4. also apply to glazed openings in detached garages and accessory buildings.

---

### **Provision: 9.10.14.4.(11)**

#### **Intent(s)**

*Intent 1.* To exempt detached garages and accessory buildings facing dwelling units from the requirements of Sentence 9.10.14.4.(1), which would otherwise limit the area of glazed openings, if certain conditions are met, on the basis that detached garages and accessory buildings are considered an integral part of a dwelling unit, and such structures are generally very small and the incidence of fires in such structures in relation to house fires is low. There is insufficient risk, therefore, to require the spatial separation of a house from its garage or carport.

**Provision: 9.10.14.5.(1)**

---

**Objective**

OP3

**Attributions**

[F02, F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that an exposing building face will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To limit the probability that an exposing building face will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

**Provision: 9.10.14.5.(2)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- fire will spread from the subject building to an adjacent building, which could lead to damage to the adjacent building,
- fire will spread from the subject building to an adjacent building through unprotected openings, which could lead to damage to the adjacent building, and
- an exposing building face will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

**Provision: 9.10.14.5.(3)**

---

**Objective**

OP3

**Attributions**

[F02, F03-OP3.1]

**Intent(s)**

*Intent 1.* To exempt cladding from the requirements of Sentences 9.10.14.5.(1) and 9.10.14.5.(2) [specifically “Type of Cladding Required” in Table 9.10.14.5.-A], if certain conditions are met.

This is to limit the probability that:

- fire will spread from the subject building to an adjacent building, which could lead to damage to the adjacent building,
- fire will spread from the subject building to an adjacent building through unprotected openings, which could lead to damage to the adjacent building, and

---

## **Intent Statements: NBC 2010**

- an exposing building face will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.14.5.(4)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.14.5.(1), which might otherwise require a higher fire-resistance rating, if certain conditions are met.

This is to limit the probability that an exposing building face will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To exempt the exterior cladding of certain detached garages or accessory buildings from the requirements of Sentences 9.10.14.5.(1) and 9.10.14.5.(2), which might otherwise require the cladding to be noncombustible, on the basis that the accessory buildings and garages serve one dwelling unit only and such structures are not expected to be normally occupied.

---

### **Provision: 9.10.14.5.(5)**

#### **Intent(s)**

*Intent 1.* To exempt detached garages and accessory buildings facing dwelling units from the requirements of Sentence 9.10.14.5.(1) and Sentence 9.10.14.5.(4), which would otherwise impose certain minimum requirements relating to fire-resistance rating, type of construction and type of cladding for exposing building faces, if certain conditions are met, on the basis that detached garages and accessory buildings are considered an integral part of a dwelling unit, and such structures are generally very small and the incidence of fires in such structures in relation to house fires is low. There is insufficient risk, therefore, to require the spatial separation of a house from its garage or carport.

---

### **Provision: 9.10.14.5.(6)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

**Provision: 9.10.14.5.(7)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To exempt buildings containing only 1 or 2 dwelling units and detached garages or accessory buildings from the requirements of Sentence 9.10.14.5.(6), if certain conditions are met, on the basis that detached garages and accessory buildings are considered an integral part of a dwelling unit, and such structures are generally very small and the incidence of fires in such structures in relation to house fires is low. There is insufficient risk, therefore, to require the spatial separation of a house from its garage or carport.

**Provision: 9.10.14.5.(8)**

---

**Objective**

OP3

**Attributions**

[F02, F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that projections from an exposing building face will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

To limit the probability that projections from an exposing building face, will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

*Intent 2.* To limit the probability that projections from an exposing building face will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

**Provision: 9.10.14.5.(9)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the building to an adjacent building through roof soffits where buildings are very closely spaced during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.10.14.5.(10)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the building to an adjacent building through roof soffits where buildings are closely spaced during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.14.5.(11)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the building to an adjacent building through roof soffits or openings in soffits where buildings are very closely spaced during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.14.5.(12)**

#### **Intent(s)**

*Intent 1.* To exempt heavy timber and steel columns from the requirements of Sentence 9.10.14.5.(1), which would otherwise impose certain minimum construction requirements relating to fire-resistance rating and type of construction, if certain conditions are met, on the basis that:

- the limiting distance is sufficient to limit the probability of severe fire exposure of the columns in the event of a fire outside the building, and
- the columns are outside the building and protected from exposure to a fire in the building by the exterior walls.

---

### **Provision: 9.10.14.5.(13)**

#### **Intent(s)**

*Intent 1.* To exempt certain buildings from the requirements of Sentence 9.10.14.5.(1), which would otherwise impose certain minimum construction requirements relating to fire-resistance rating and type of construction, if certain conditions are met [i.e. the limiting distance is not less than 3 m]. This is on the basis that the risk of exposure of adjacent buildings to fire is low due to the limitations on the type of occupancy, the type of construction and the limiting distance.

---

### **Provision: 9.10.15.1.(1)**

#### **Intent(s)**

*Intent 1.* To state the application of Subsection 9.10.15.

*Intent 2.* To exempt buildings that contain only dwelling units and have no dwelling unit above another dwelling unit and houses with secondary suites including common spaces from the requirements of Subsection 9.10.14.

---

**Provision: 9.10.15.2.(1)**

---

**Intent(s)**

*Intent 1.* To state how to calculate the area of an exposing building face.

---

**Provision: 9.10.15.2.(2)**

---

**Intent(s)**

*Intent 1.* To limit subdivision of exterior walls for the purpose of calculating the area of an exposing building face where the building is close to the property line, as such subdivision could increase concentrations of glazed opening areas serving a single room or space and consequently increase radiant heat flux in the case of a fire in that space.

---

**Provision: 9.10.15.2.(3)**

---

**Intent(s)**

*Intent 1.* To clarify how the location of an exposing building face is determined in Subsection 9.10.15., for the purpose of determining the maximum area of glazed openings permitted in irregularly shaped or skewed exterior walls.

---

**Provision: 9.10.15.2.(4)**

---

**Intent(s)**

*Intent 1.* To clarify how the location of an exposing building face is determined in Subsection 9.10.15., for the purpose of determining the type of cladding-sheathing assembly and the minimum fire-resistance rating for irregularly shaped or skewed exterior walls.

*Intent 2.* To direct Code users to Article 9.10.15.5., which contains requirements for types of cladding/sheathing assemblies and minimum fire-resistance ratings.

---

**Provision: 9.10.15.3.(1)**

---

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To redefine limiting distance as being less than actual in cases where the time from receipt of notification of a fire by the fire department until the first fire department vehicle arrives at the building is longer than assumed for the application of requirements based on limiting distance, and where protection is not provided by sprinklers.

---

## **Intent Statements: NBC 2010**

This is to limit the probability that fire will spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.15.4.(1)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To expand the application of Subsection 3.2.3. to Part 9 buildings.

---

### **Provision: 9.10.15.4.(2)**

#### **Intent(s)**

*Intent 1.* To state how to calculate the area of glazed openings for individual portions of an exterior wall.

---

### **Provision: 9.10.15.4.(3)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building, where the limiting distance is short, to an adjacent building through concentrations of glazed opening areas during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.15.4.(4)**

#### **Objective**

OP3

#### **Attributions**

[F03-OP3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building, where limiting distance is short, to an adjacent building through closely spaces glazed openings during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.15.4.(5)**

**Intent(s)**

*Intent 1.* To specify the configuration of rooms or spaces or openings between rooms or spaces for them to be considered as a single room or space for the determination of minimum spacing of glazed openings in exposing building faces.

**Provision: 9.10.15.4.(6)**

---

**Intent(s)**

*Intent 1.* To exempt dwelling units facing detached garages or accessory buildings from the requirements of Sentence 9.10.15.4.(1), which would otherwise limit the area of glazed openings, if certain conditions are met, on the basis that detached garages and accessory buildings are considered an integral part of a dwelling unit and such structures are generally very small. There is insufficient risk, therefore, to require the spatial separation of a house from its garage or carport.

**Provision: 9.10.15.5.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Sentences 9.10.15.5.(2) and 9.10.15.5.(3).

**Provision: 9.10.15.5.(2)**

---

**Objective**

OP3

**Attributions**

[F02, F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- an exposing building face will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building, and
- an exposing building face will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To direct Code users to Subsection 9.27.11.

**Provision: 9.10.15.5.(3)**

---

**Objective**

OP3

**Attributions**

[F02, F03-OP3.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that an exposing building face will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To limit the probability that an exposing building face will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

---

### **Intent(s)**

*Intent 1.* To direct Code users to Subsections 9.27.6. to 9.27.10. and 9.27.12.

---

### **Provision: 9.10.15.5.(4)**

---

### **Intent(s)**

*Intent 1.* To exempt exposing building faces and projections from exposing building faces of certain dwelling units facing detached garages or accessory buildings and of certain detached garages or accessory buildings facing a dwelling unit from the requirements of Sentences 9.10.15.5.(1) to 9.10.15.5.(3), which would otherwise require certain limiting distances, on the basis that detached garages and accessory buildings are considered an integral part of a dwelling unit, and such structures are generally very small and the incidence of fires in such structures in relation to house fires is low. There is insufficient risk, therefore, to require the spatial separation of a house from its garage or carport.

---

### **Provision: 9.10.15.5.(5)**

---

### **Objective**

OP3

### **Attributions**

[F03-OP3.1]

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.15.5.(6)**

---

### **Intent(s)**

*Intent 1.* To exempt combustible projections from certain buildings or detached garages from the application of Sentence 9.10.15.5.(5), if certain conditions are met, on the basis that fire spread from the subject building to an adjacent building during the time required for emergency responders to perform their duties is less likely to result in serious damage to the adjacent building.

---

**Provision: 9.10.15.5.(7)**

**Objective**

OP3

**Attributions**

[F02, F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that projections from an exposing building face will have insufficient fire resistance, which could lead to the spread of fire from the subject building to an adjacent building during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

*Intent 2.* To limit the probability that projections from an exposing building face, will be ignited and contribute to, or be involved in, a fire, which could lead to the spread of fire from the subject building to an adjacent building, which could lead to damage to the adjacent building.

---

**Provision: 9.10.15.5.(8)**

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the building to an adjacent building through roof soffits where buildings are very closely spaced during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

**Provision: 9.10.15.5.(9)**

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

*Intent 1.* To limit the probability that fire will spread from the building to an adjacent building through roof soffits where buildings are closely spaced during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

**Provision: 9.10.15.5.(10)**

**Objective**

OP3

**Attributions**

[F03-OP3.1]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that fire will spread from the building to an adjacent building through roof soffits or openings in soffits where buildings are very closely spaced during the time required for emergency responders to perform their duties, which could lead to damage to the adjacent building.

---

### **Provision: 9.10.15.5.(11)**

---

#### **Intent(s)**

*Intent 1.* To clarify that combustible or noncombustible finish material may be installed on protected soffits where these would not affect the degree of combustibility of the building.

---

### **Provision: 9.10.15.5.(12)**

---

#### **Intent(s)**

*Intent 1.* To exempt heavy timber and steel columns from the requirements of Sentence 9.10.14.5.(1), which would otherwise impose certain minimum requirements relating to fire-resistance rating and type of construction, if certain conditions are met, on the basis that:

- the limiting distance is sufficient to limit the probability of severe fire exposure of the columns in the event of a fire outside the building, and
- the columns are outside the building and protected from exposure to a fire in the building by the exterior walls.

---

### **Provision: 9.10.16.1.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces in wall assemblies will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces in wall assemblies will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

**Provision: 9.10.16.1.(2)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that concealed spaces in attics, roof spaces, ceilings, floors, and crawl spaces will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that concealed spaces in attics, roof spaces, ceilings, floors, and crawl spaces will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

**Provision: 9.10.16.1.(3)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that concealed spaces in interior coved ceilings, drop ceilings and soffits will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that concealed spaces in interior coved ceilings, drop ceilings and soffits will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.16.1.(4)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces at the top and bottom of each run of stairs will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces at the top and bottom of each run of stairs will not be separated from certain other concealed spaces, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces created by a ceiling, roof space or unoccupied attic space will not be separated into fire compartments, which could lead to the growth and spread of fire within these spaces, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces created by a ceiling, roof space or unoccupied attic space will not be separated into fire compartments, which could lead to the growth and spread of fire within these spaces, which could lead to damage to the building.

**Provision: 9.10.16.1.(6)**

---

**Objective**

OS1

**Attributions**

[F02, F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that an extensive fire will develop in a large concealed roof or ceiling space where surface flame spread is likely to be relatively rapid, which could lead to the spread of fire to other parts of the building, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F02, F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that an extensive fire will develop in a large concealed roof or ceiling space where surface flame spread is likely to be relatively rapid, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

**Provision: 9.10.16.1.(7)**

---

**Objective**

OS1

**Attributions**

[F02, F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that certain concealed spaces [at the ends of required vertical fire separations] in mansard or gambrel style roofs, exterior cornices, balconies and canopies will not be fire blocked, which could lead to the spread of fire from one side of the fire separation through these spaces to the other side of the fire separation, which could lead to harm to persons on the other side of the fire separation.

*Intent 2.* To limit the probability that concealed spaces in mansard or gambrel style roofs, exterior cornices, balconies and canopies will not be separated, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F02, F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that certain concealed spaces [at the ends of required vertical fire separations] in mansard or gambrel style roofs, exterior cornices, balconies and canopies will not be fire blocked, which could lead to the spread of fire from one side of the fire separation through these spaces to the other side of the fire separation, which could lead to damage to the building on the other side of the fire separation.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To limit the probability that concealed spaces in mansard or gambrel style roofs, exterior cornices, balconies and canopies will not be separated, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

### **Provision: 9.10.16.2.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces within wall assemblies will not be separated at certain locations, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F03-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that concealed spaces within wall assemblies will not be separated at certain locations, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

### **Provision: 9.10.16.2.(2)**

---

#### **Intent(s)**

*Intent 1.* To exempt wall spaces from the application of Sentence 9.10.16.2.(1), which would otherwise require fire blocking, if certain conditions are met, on the basis that the conditions provide an equivalent level of protection and the risk of fire spreading from a concealed wall space to or through another concealed wall space is minimized.

### **Provision: 9.10.16.3.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that inappropriate material will be used for fire blocks, which could lead to the material not remaining in place for a certain minimum amount of time under fire conditions, which could lead to the failure of the material to resist the passage of flames, which could lead to the spread of fire within spaces that are fire blocked, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that inappropriate material will be used for fire blocks, which could lead to the material not remaining in place for a certain minimum amount of time under fire conditions, which could lead to the failure of the material to resist the passage of flames, which could lead to the spread of fire within spaces that are fire blocked, which could lead to damage to the building.

---

**Provision: 9.10.16.3.(2)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire blocking material used to block and separate concealed spaces will not remain in place for a certain minimum amount of time under fire conditions, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F03-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire blocking material used to block and separate concealed spaces will not remain in place for a certain minimum amount of time under fire conditions, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

---

**Provision: 9.10.16.3.(3)**

---

**Objective**

OS1

**Attributions**

[F04-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that fire stopping material used to block and separate concealed spaces will not remain in place for a certain minimum amount of time under fire conditions, which could lead to the spread of fire within these spaces, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

[F04-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that fire stopping material used to block and separate concealed spaces will not remain in place for a certain minimum amount of time under fire conditions, which could lead to the spread of fire within these spaces, which could lead to damage to the building.

---

### **Provision: 9.10.16.4.(1)**

---

### **Objective**

OS1

### **Attributions**

[F03-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the effectiveness of fire blocks that are pierced by pipes, ducts or other elements will not be maintained, which could lead to the passage of fire through openings at these penetrations, which could lead to the spread of fire within spaces that are fire blocked, which could lead to harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that the effectiveness of fire blocks that are pierced by pipes, ducts or other elements will not be maintained, which could lead to the passage of fire through openings at these penetrations, which could lead to the spread of fire within spaces that are fire blocked, which could lead to damage to the building.

---

### **Provision: 9.10.17.1.(1)**

---

### **Objective**

OS1

### **Attributions**

[F02-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that certain finishes having an inappropriately high flame spread property will be used, which could lead to the spread of fire across the exposed surfaces of the finishes, which could lead to harm to persons.

---

### **Provision: 9.10.17.1.(2)**

---

**Intent(s)**

*Intent 1.* To exempt doors from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and permit a higher maximum flame-spread rating, on the basis that the higher rating will not contribute significantly to the spread of flame across the door surface.

**Provision: 9.10.17.1.(3)**

---

**Intent(s)**

*Intent 1.* To exempt certain doors from the requirements of Sentence 9.10.17.1.(1) and Sentence 9.10.17.1.(2), which would otherwise limit surface flame-spread rating, on the basis that the doors will not contribute significantly to the spread of flame.

**Provision: 9.10.17.2.(1)**

---

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To exempt certain ceilings from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and require a lower maximum flame-spread rating on at least 90% of the exposed ceiling surface, on the basis that the lower flame-spread rating is needed in these locations [exits or public corridors that are a part of a means of egress] to protect persons during evacuation.

*Intent 2.* To limit the probability that certain finishes having an inappropriately high flame-spread property will be used in exits or public corridors that are a part of a means of egress, which could lead to the spread of fire across the exposed surfaces of the finishes, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.17.3.(1)**

---

**Objective**

OS1

**Attributions**

[F05-OS1.5]

**Intent(s)**

*Intent 1.* To exempt certain walls from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and require a lower maximum flame-spread rating on at least 90% of the exposed wall surface, on the basis that the lower flame-spread rating is needed in exits to protect persons during evacuation.

*Intent 2.* To limit the probability that certain finishes having an inappropriately high flame-spread property will be used in exits, which could lead to the spread of fire across the exposed surfaces of the finishes, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.17.3.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To exempt certain walls from the requirements of Sentence 9.10.17.3.(1), which would otherwise limit surface flame-spread rating to 25 on at least 90% of the exposed wall surface, and permit a maximum surface flame-spread rating of 25 on at least 75% of the exposed wall surface, on the basis that the increased surface area where the flame-spread rating may be more than 25 will not contribute significantly to the spread of flame.

*Intent 2.* To limit the probability that certain finishes having an inappropriately high flame-spread property will be used in a lobby used as an exit, which could lead to the spread of fire across the exposed surfaces of the finishes, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.10.17.4.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To exempt wall and ceiling finishes in exterior exit passageways from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and require a lower maximum flame-spread rating on at least 90% of the surface areas, on the basis that the lower rating is needed in these locations to protect persons during evacuation.

*Intent 2.* To limit the probability that certain finishes having an inappropriately high flame-spread property will be used in certain passageways that provide means of egress, which could lead to the spread of fire across the exposed surfaces of the finishes, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

### **Provision: 9.10.17.5.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F05-OS1.5]

#### **Intent(s)**

*Intent 1.* To exempt wall surfaces in unsprinklered public corridors from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and require a lower maximum flame-spread rating on certain portions of the surface areas, on the basis that the lower rating is needed in these locations to protect persons during evacuation.

*Intent 2.* To limit the probability that certain finishes having an inappropriately high flame-spread property will be used in public corridors that are part of a means of egress, which could lead to the spread of fire

across the exposed surfaces of the finishes, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.10.17.6.(1)**

---

**Intent(s)**

*Intent 1.* To exempt skylights, glazing, combustible doors, and combustible light diffusers and lenses from the requirements of Subsection 9.10.17. pertaining to the calculation of wall and ceiling areas, on the basis that these building elements will not contribute significantly to the spread of flame.

---

**Provision: 9.10.17.7.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of the flame-spread rating limits for corridors, specified in Sentence 9.10.17.2.(1) and Sentence 9.10.17.5.(1), to occupancies in the corridors.

---

**Provision: 9.10.17.8.(1)**

---

**Intent(s)**

*Intent 1.* To exempt light diffusers and lenses from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and permit a higher maximum flame-spread rating and require certain other conditions to be met as stated in Sentence 3.1.13.4.(1), on the basis that these building elements will not contribute significantly to the spread of flame.

*Intent 2.* To expand the application of Sentence 3.1.13.4.(1) to Part 9 buildings.

---

**Provision: 9.10.17.9.(1)**

---

**Objective**

OS1

**Attributions**

[F02, F05-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that combustible skylights will be inappropriately large and spaced closely together, which could lead to an inappropriate amount of combustible material located in close proximity, which could contribute significantly to the growth and spread of fire, which could lead to delays in the evacuation or movement of persons using the corridor to a safe place, which could lead to harm to persons.

---

**Provision: 9.10.17.10.(1)**

---

**Objective**

OS1

**Attributions**

9.10.17.10.(1)(a), 9.10.17.10.(1)(b), 9.10.17.10.(1)(c) [F01, F02, F05-OS1.5]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that foamed plastic insulation will be exposed to a fire or subjected to high temperatures, which could lead to its ignition and contribution to the early growth and spread of fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Attributions**

9.10.17.10.(1)(a)

### **Intent(s)**

*Intent 1.* To state the application of Subsections 9.29.4. to 9.29.9.

---

### **Attributions**

9.10.17.10.(1)(c)

### **Intent(s)**

*Intent 1.* To expand the application of Clause 3.1.5.12.(2)(e) to Part 9 buildings.

---

## **Provision: 9.10.17.10.(2)**

---

### **Objective**

OS1

### **Attributions**

[F01, F02-OS1.2]

### **Intent(s)**

*Intent 1.* To exempt thermosetting foamed plastic insulation used in factory-assembled doors from the requirements of Sentence 9.10.17.10.(1), which would otherwise require certain protective coverings over the foamed plastic, if certain conditions are met.

This is to limit the probability that the foamed plastic insulation will be exposed to a fire, which could lead to its ignition and contribution to the early growth and spread of fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Provision: 9.10.17.11.(1)**

---

### **Intent(s)**

*Intent 1.* To exempt the interior finish of walls and ceilings in bathrooms from the requirements of Sentence 9.10.17.1.(1), which would otherwise limit surface flame-spread rating to 150, and permit a higher maximum flame-spread rating, on the basis that the incidence rate of fires in bathrooms is much lower than in most other parts of a residential suite, bathrooms are usually very small and generally have little effect on the rate of the spread of fire within a suite, and the higher rating will not contribute significantly to the spread of flame.

---

## **Provision: 9.10.17.12.(1)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Sentence 9.10.17.1.(1).

*Intent 2.* To expand the application of Article 3.6.5.4. to Part 9 buildings.

**Provision: 9.10.18.1.(1)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons on one side of a firewall will not be promptly notified of a fire situation involving the other side of the firewall, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.18.2.(1)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5] [F13-OS1.2, OS1.5] [F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not be promptly notified of a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that emergency responders will not be promptly notified of a fire situation, which could lead to delays or ineffectiveness in carrying out fire emergency response operations, which could lead to:

- delays in the evacuation or movement of persons to a safe place, or
- the spread of fire.

This is to limit the probability of harm to persons.

---

**Objective**

OP1

**Attributions**

[F13-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that emergency responders will not be promptly notified of a fire situation, which could lead to delays or ineffectiveness in carrying out fire emergency response operations, which could lead to the spread of fire, which could lead to damage to the building.

**Provision: 9.10.18.2.(2)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that persons will not be promptly notified of a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.18.2.(3)**

---

### **Intent(s)**

*Intent 1.* To exempt certain buildings from the application of Sentence 9.10.18.2.(1), which would otherwise require a fire alarm system, on the basis that the buildings are limited in size and a sprinkler system is installed in accordance with NFPA 13D.

**Provision: 9.10.18.2.(4)**

---

### **Intent(s)**

*Intent 1.* To exempt certain buildings from the application of Sentence 9.10.18.2.(1), which would otherwise require a fire alarm system, on the basis that there is a limited number of sprinklers installed in the building.

**Provision: 9.10.18.2.(5)**

---

### **Intent(s)**

*Intent 1.* To exempt certain buildings from the application of Sentence 9.10.18.2.(2), which might otherwise require a fire alarm system, on the basis that the buildings are limited in size and the dwelling units have a direct means of evacuation to the exterior [persons should therefore not be delayed in reaching a safe place].

**Provision: 9.10.18.3.(1)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 3.2.4. to Part 9 buildings.

**Provision: 9.10.18.3.(2)**

---

### **Intent(s)**

*Intent 1.* To exclude the following Articles from the application to Part 9 buildings: Articles 3.2.4.1., 3.2.4.11., 3.2.4.12. , 3.2.4.13. , 3.2.4.14., 3.2.4.21., and 3.2.4.22.

**Provision: 9.10.18.4.(1)**

---

### **Objective**

OS1

### **Attributions**

[F11-OS1.5]

### **Intent(s)**

*Intent 1.* To limit the probability that smoke will not be promptly detected in spaces where the presence of smoke or fire could be critically detrimental to the safety of persons, which could lead to persons

not being notified of a fire situation in such spaces, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.10.18.4.(2)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that fire will not be detected in certain spaces, which could lead to persons not being promptly notified of a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.10.18.4.(3)**

---

**Intent(s)**

*Intent 1.* To exempt dwelling units from the requirements of Sentence 9.10.18.4.(2), which would otherwise require heat or smoke detectors in certain spaces, on the basis that dwelling units are provided with smoke alarms, as required in Subsection 9.10.18.

---

**Objective**

OS1

**Attributions**

[F02-OS1.2] Applies to *sprinklered buildings*.

[F11-OS1.5] Applies to the supervision of the system and the flow alarm.

**Intent(s)**

*Intent 1.* To exempt buildings from the requirements of Sentence 9.10.18.4.(2), which would otherwise require heat or smoke detectors in certain spaces, if certain conditions are met [i.e. the building is sprinklered and the sprinkler system is electrically supervised and equipped with a water flow alarm].

This is to limit the probability that a fire will not be:

- controlled or suppressed, which could lead to the growth and spread of fire, and
- detected, which could lead to persons not being promptly notified of a fire situation.

This is to limit the probability of delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Provision: 9.10.18.5.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that smoke will spread between storeys or suites by means of an air handling system, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

*Intent 2.* To limit the probability that smoke originating from a fire in an air handling system will spread through the duct system, which could lead to harm to persons.

### **Provision: 9.10.18.6.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.18.2.(2) and permit a fire alarm system in only a portion of a building, if certain conditions are met.

These conditions are to limit the probability that:

- the separations between the portions of the building will have insufficient fire resistance, which could lead to the spread of fire from one portion of the building to another portion, and
- fire and combustion by-products will spread from one portion of the building to another portion through openings in the separation between building portions.

This is to limit the probability of harm to persons in the other portion of the building.

### **Provision: 9.10.18.6.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F11-OS1.2]

#### **Intent(s)**

*Intent 1.* To exempt certain rooms from the application of Sentence 9.10.18.6.(1), which would otherwise allow these rooms to be considered as separate buildings for the purpose of fire alarm system design and installation.

This is to limit the probability that a fire will develop and grow undetected in an unoccupied service room or storage room, which could lead to the spread of fire to other parts of the building, which could lead to harm to persons.

### **Provision: 9.10.18.7.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F03-OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that smoke will spread between storeys, suites or fire compartments by means of an air handling system, which could lead to harm to persons.

### **Provision: 9.10.18.8.(1)**

---

**Intent(s)**

*Intent 1.* To exempt open-air storage garages from the application of Sentence 9.10.18.2.(2), which might otherwise require a fire alarm system, on the basis that there are no other occupancies in the building [thus minimizing fire risks], the construction is noncombustible and the storeys are open-air.

**Provision: 9.10.19.1.(1)**

---

**Objective**

OS1

**Attributions**

[F81, F11-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of smoke alarms will fall significantly below expectations in a fire situation, which could lead to persons not being properly notified of the fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that a fire will not be detected in dwelling units, sleeping rooms, ancillary spaces or common spaces not in dwelling units in houses containing secondary suites, which could lead to persons not being promptly notified of the fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.19.2.(1)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons will not recognize smoke alarm signals, which could lead to inappropriate action being taken in a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.19.3.(1)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that a fire involving a storey will not be detected, which could lead to persons on that storey or on another storey not being promptly notified of the fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that persons in sleeping rooms will not be promptly notified of a fire in other parts of the dwelling unit or within their room, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Provision: 9.10.19.3.(2)**

#### **Objective**

OS1

#### **Attributions**

[F81, F11-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that smoke alarms will not meet proper standards, which could lead to such devices not performing in the way intended in a fire situation, which could lead to persons not being promptly notified of the fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.10.19.3.(3)**

#### **Objective**

OS1

#### **Attributions**

[F11-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that a fire will not be quickly detected, which could lead to persons not being promptly notified of the fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.10.19.4.(1)**

#### **Objective**

OS1

#### **Attributions**

[F11, F81-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that electrical connections and circuits for smoke alarms will be disconnected, or suffer a power failure, which could lead to the smoke alarms not operating in a fire situation, which could lead to persons not being promptly notified of the fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.10.19.4.(2)**

#### **Intent(s)**

*Intent 1.* To exempt certain buildings from the requirements of Sentence 9.10.19.4.(1), which would otherwise require smoke alarms to be installed with permanent connections to an electrical circuit, on the basis that such buildings are not supplied with electrical power and battery-operated smoke alarms will provide an acceptable level of performance in such circumstances.

**Provision: 9.10.19.4.(3)**

---

**Objective**

OS1

**Attributions**

[F11, F81-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that smoke detectors will not meet proper standards, which could lead to such devices not performing in the way intended in a fire situation, which could lead to persons not being properly notified of the fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

*Intent 2.* To limit the probability that a fire will not be detected in suites of residential occupancy, which could lead to persons in such rooms not being promptly notified of the fire, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

**Intent(s)**

*Intent 1.* To exempt suites of residential occupancy from the requirements of Sentence 9.10.19.4.(1), on the basis that smoke detectors installed in accordance with CAN/ULC-S524 and connected to the fire alarm system are deemed to provide an equivalent level of performance to that of smoke alarms.

**Provision: 9.10.19.4.(4)**

---

**Intent(s)**

*Intent 1.* To exempt smoke detectors in certain areas from the full installation requirements stipulated within the referenced standard and allow the smoke detectors to function as per the requirements of smoke alarms under this application.

**Provision: 9.10.19.5.(1)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability that persons in one part of the dwelling unit will not be promptly notified of a fire in another part of the dwelling unit, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

**Provision: 9.10.19.5.(2)**

---

**Objective**

OS1

**Attributions**

[F11-OS1.5]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that persons in any part of the house with a secondary suite will not be promptly notified of a fire in another part of the house, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.10.19.6.(1)**

#### **Objective**

OS1

#### **Attributions**

[F11, F81-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that smoke alarms will:

- be inadvertently or purposely silenced [made inoperative or damaged] as a result of false alarms, which could lead to the signal devices not operating in a fire situation, which could lead to persons not being promptly notified of a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons, and
- not be restored to normal operation after being silenced, which could lead to the signal devices not operating in a fire situation, which could lead to persons not being notified of a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.10.19.6.(2)**

#### **Intent(s)**

*Intent 1.* To exempt smoke detectors from the requirements of Sentence 9.10.19.6.(1), which would otherwise require a manually operated silencing device within the circuitry, on the basis that achieving this for smoke detectors installed in conformance with CAN/ULC-S524 would be difficult.

---

### **Provision: 9.10.19.7.(1)**

#### **Objective**

OS1

#### **Attributions**

[F82-OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability that smoke alarms will not be maintained at the level of performance originally intended, which could lead to the failure or improper operation of smoke alarms in a fire situation, which could lead to persons not being notified of a fire situation, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Provision: 9.10.20.1.(1)**

#### **Objective**

OS1

#### **Attributions**

[F12-OS1.2, OS1.5]

**Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to:

- delays in the evacuation or movement of persons to a safe place, and
- the spread of fire to other parts of the building.

This is to limit the probability of harm to persons.

---

**Objective**

OP1

**Attributions**

[F12-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

---

**Provision: 9.10.20.1.(2)**

---

**Objective**

OS1

**Attributions**

[F12-OS1.5, OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to:

- delays in the evacuation or movement of persons to a safe place, and
- the spread of fire to other parts of the building.

This is to limit the probability of harm to persons.

---

**Objective**

OP1

[F12-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

---

**Provision: 9.10.20.1.(3)**

---

**Intent(s)**

*Intent 1.* To exempt certain buildings and houses with a secondary suite from the requirements of Sentence 9.10.20.1.(1), which would otherwise require access panels, on the basis that the buildings and houses are expected to be readily accessible by firefighters at ground level and various points of entry at other levels.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.20.2.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F12-OS1.2, OS1.5]

#### **Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to:

- delays in the evacuation or movement of persons to a safe place, and
- the spread of fire to other parts of the building.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP1

#### **Attributions**

[F12-OP1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

### **Provision: 9.10.20.2.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F12-OS1.2, OS1.5] Applies to portion of Code text: " Access required in Sentence 9.10.20.2.(1) ... provides an opening not less than 1 100 mm high and 550 mm wide, the sill height of which shall not be more than 900 mm above the floor."

#### **Intent(s)**

*Intent 1.* To limit the probability of delays or ineffectiveness in fire emergency response operations, which could lead to:

- delays in the evacuation or movement of persons to a safe place, and
- the spread of fire to other parts of the building.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F81, F02-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that low temperatures will cause blockage or impairment of fire protection system equipment, which could lead to improper operation of the equipment in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to the spread of fire, which could lead to harm to persons.

---

**Objective**

OP1

**Attributions**

[F81, F02-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that low temperatures will cause blockage or impairment of fire protection system equipment, which could lead to improper operation of the equipment in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to the spread of fire, which could lead to damage to the building.

---

**Provision: 9.10.21.1.(1)**

---

**Intent(s)**

*Intent 1.* To clarify that the more specific requirements in Subsection 9.10.21. are intended to supersede anything else in Section 9.10. in cases of conflict.

*Intent 2.* To direct Code users to Subsections 9.10.1. to 9.10.19.

---

**Provision: 9.10.21.2.(1)**

---

**Objective**

OS1

**Attributions**

[F03-OS1.2]

**Intent(s)**

*Intent 1.* To supersede the requirements of Sentences 9.10.9.14.(1) and 9.10.9.14.(1), which would otherwise require a fire separation having a minimum 45 min fire-resistance rating, and permit a lower minimum fire-resistance rating, on the basis that this rating is considered adequate for construction camps.

*Intent 2.* To limit the probability that fire will spread from an area in a construction camp to a sleeping room in the camp, which could lead to harm to persons in the sleeping room.

---

**Intent(s)**

*Intent 1.* To exempt sleeping rooms within dwelling units from the requirement in the latter part of Sentence 9.10.21.2.(1) for a minimum 30 min rated separation, on the basis that the sleeping rooms are equipped with smoke alarms and have a small occupant load, which should enable persons to quickly escape in the early stages of a fire.

---

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that fire will spread from one building to another [connected] building by means of a walkway during the time required to achieve occupant safety and for emergency responders to perform their duties, which could lead to harm to persons in the connected building.

---

### **Objective**

OP1

### **Attributions**

[F03-OP1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from an adjacent building to the [connected] building by means of a walkway, which could lead to damage to the building.

---

### **Objective**

OP3

### **Attributions**

[F03-OP3.1]

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from one building to another [connected] building by means of a walkway, which could lead to damage to the other building.

---

## **Provision: 9.10.21.5.(1)**

---

### **Objective**

OP3

### **Attributions**

[F03-OP3.1]

### **Intent(s)**

*Intent 1.* To limit the probability that fire will spread from one building to another during the time required for emergency responders to perform their duties, which could lead to damage to the building in the other building.

---

## **Provision: 9.10.21.6.(1)**

---

### **Objective**

OS1

### **Attributions**

[F05-OS1.5, OS1.2]

### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentences 9.10.17.1.(1) and 9.10.21.1.(1), which would otherwise limit the flame-spread rating to 150, and require a lower limit over not less than 90% of the exposed surface area, on the basis that the corridors and walkways will be used as part of a means of egress and are thus required to have increased protection from the spread of fire.

*Intent 2.* To limit the probability that certain finishes having an inappropriately high flame-spread property will be used in the corridors and walkways of construction camps, which could lead to the spread of fire across the exposed surfaces of the finishes, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Intent(s)**

*Intent 1.* To exempt wall and ceiling surfaces of corridors and walkways within dwelling units from the requirement in the latter part of Sentence 9.10.21.6.(1) for a certain maximum flame-spread rating, on the basis that the dwelling units are equipped with smoke alarms and have a small occupant load, which should enable persons to quickly escape in the early stages of a fire.

### **Provision: 9.10.21.6.(2)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 9.10.16.[specifically Sentences 9.10.17.1.(1), 9.10.17.2.(1) and 9.10.17.5.(1)] to include construction camp corridors that:

- provide access to exit from sleeping rooms, and
- have a fire-resistance rating of not less than 45 min.

---

### **Intent(s)**

*Intent 1.* To exempt the surfaces of corridors within dwelling units from the requirement in the latter part of Sentence 9.10.21.6.(2) for a certain maximum flame-spread rating, on the basis that the dwelling units are equipped with smoke alarms and have a small occupant load, which should enable persons to quickly escape in the early stages of a fire.

### **Provision: 9.10.21.7.(1)**

---

### **Objective**

OS1

### **Attributions**

[F11-OS1.5]

### **Intent(s)**

*Intent 1.* To limit the probability that the occupants of sleeping rooms [in buildings that are sufficiently large that a smoke alarm in a sleeping room might not be audible to occupants in all other sleeping rooms] will not be promptly notified of a fire in another part of the building, which could lead to delays in the evacuation or movement of persons to a safe place, which could lead to harm to persons.

---

### **Intent(s)**

*Intent 1.* To exempt dwelling units from the requirement in the latter part of Sentence 9.10.21.7.(1) for smoke detectors in corridors providing access to exit from sleeping rooms, on the basis that the dwelling units are equipped with smoke alarms and have a small occupant load, which should enable persons to quickly escape in the early stages of a fire.

### **Provision: 9.10.21.8.(1)**

---

### **Objective**

OP1

### **Attributions**

[F81, F12, F02-OP1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of portable extinguishers will fall significantly below expectations in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

*Intent 2.* To limit the probability of delays in accessing portable extinguishers in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to the spread of fire to other parts of the building, which could lead to damage to the building.

*Intent 3.* To supersede the requirements of Sentence 9.10.20.4.(1).

---

**Objective**

OS1

**Attributions**

[F81, F12, F02-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of portable extinguishers will fall significantly below expectations in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to the spread of fire to other parts of the building, which could lead to harm to persons.

*Intent 2.* To limit the probability of delays in accessing portable extinguishers in a fire situation, which could lead to the fire not being controlled or suppressed, which could lead to the spread of fire to other parts of the building, which could lead to harm to persons.

*Intent 3.* To supersede the requirements of Sentence 9.10.20.4.(1).

**Provision: 9.10.22.1.(1)**

---

**Objective**

OS1

**Attributions**

[F81, F43, F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that natural gas and propane cooktops and ovens will not meet proper standards, which could lead to such appliances not performing in the way intended, which could lead to a fire or explosion, which could lead to harm to persons.

---

**Objective**

OS3

**Attributions**

[F81, F43-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that natural gas and propane cooktops and ovens will not meet proper standards, which could lead to such appliances not performing in the way intended, which could lead to the accumulation of harmful gases or vapours to levels that could pose a risk to human health from short-term exposure, which could lead to harm to persons.

---

**Provision: 9.10.22.1.(2)**

---

**Intent(s)**

*Intent 1.* To state the application of Articles 9.10.22.2. and 9.10.22.3.

*Intent 2.* To supersede the requirements stated in CSA B149.1, referred to in Sentence 9.10.22.1.(1), with regard to natural gas ranges, in cases of conflict.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.10.22.2.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1, OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that heat radiating from a cooktop or from an open fire will ignite nearby framing, finishes or cabinetry, which could lead to the spread of fire, which could lead to harm to persons.

*Intent 2.* To supersede the requirements stated in CAN/CSA-B149.1, referred to in Sentence 9.10.22.1.(1), with regard to natural gas and propane cooktops, in cases of conflict.

### **Provision: 9.10.22.2.(2)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1, OS1.2]

#### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.22.2.(1) and permit a reduction in vertical clearance, if certain conditions are met.

This is to limit the probability that heat radiating from a cooktop or from an open fire will ignite nearby framing, finishes or cabinetry, which could lead to the spread of fire, which could lead to harm to persons.

*Intent 2.* To supersede the requirements stated in CAN/CSA-B149.1, referred to in Sentence 9.10.22.1.(1), with regard to natural gas and propane cooktops, in cases of conflict.

### **Provision: 9.10.22.3.(1)**

---

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1, OS1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability that heat radiating from a cooktop or from an open fire will ignite nearby framing, finishes or cabinetry, which could lead to the spread of fire, which could lead to harm to persons.

*Intent 2.* To supersede the requirements stated in CAN/CSA-B149.1, referred to in Sentence 9.10.22.1.(1), with regard to natural gas and propane cooktops, in cases of conflict.

### **Provision: 9.10.22.3.(2)**

---

#### **Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To supersede the requirements of Sentence 9.10.22.3.(1) and not require a protective covering, on the basis that the construction and location of such countertop elements are such that the elements are not expected to be ignited by range burners or elements.

*Intent 2.* To supersede the requirements stated in CSA B149.1, referred to in Sentence 9.10.22.1.(1), with regard to natural gas ranges, in cases of conflict.

---

### **Provision: 9.10.22.3.(3)**

#### **Objective**

OS1

#### **Attributions**

[F01-OS1.1, OS1.2]

#### **Intent(s)**

*Intent 1.* To supersede the requirements of Sentence 9.10.22.3.(1) and not require a protective covering, if certain conditions are met [minimum clearance].

This is to limit the probability that heat radiating from a range or from open fire will ignite the cabinetry, which could lead to the spread of fire, which could lead to harm to persons.

*Intent 2.* To supersede the requirements stated in CSA B149.1, referred to in Sentence 9.10.22.1.(1), with regard to natural gas ranges, in cases of conflict.

---

### **Provision: 9.11.1.1.(1)**

#### **Objective**

OH3

#### **Attributions**

[F56-OH3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants in one part of a building will be exposed to excessive levels of airborne noise from other parts of a building, which could lead to negative effects on the psychological well-being of persons.

---

### **Provision: 9.11.2.1.(1)**

#### **Objective**

OH3

#### **Attributions**

[F56-OH3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants in one part of a building will be exposed to excessive levels of airborne noise from other parts of the building, which could lead to negative effects on the psychological well-being of persons.

*Intent 2.* To direct Code users to:

- Subsection 9.11.1., which refers to standardized methods of establishing the sound transmission class ratings of wall, floor and ceiling assemblies, and
- a series of tables in Appendix A-9.10.3.1., which list the sound transmission class ratings assigned to a selection of wall, floor and ceiling assemblies.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.11.2.1.(2)**

---

#### **Objective**

OH3

#### **Attributions**

[F56-OH3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants in one part of a house will be exposed to excessive levels of airborne noise from other parts of the house, which could lead to negative effects on the psychological well-being of persons.

*Intent 2.* To exempt houses with secondary suites from the more stringent requirements for sound transmission class ratings in Sentence 9.11.2.1.(1), on the basis that it may be cost-prohibitive where the secondary suite would be constructed as a retrofit and that the occupants of the house containing a secondary suite would be affected only by the sound of one other unit.

*Intent 3.* To direct Code users to:

- Subsection 9.11.1., which refers to standardized methods of establishing the sound transmission class ratings of wall, floor and ceiling assemblies, and
- a series of tables in Appendix Appendix A-9.10.3.1., which list the sound transmission class ratings assigned to a selection of wall, floor and ceiling assemblies.

### **Provision: 9.11.2.1.(3)**

---

#### **Objective**

OH3

#### **Attributions**

[F56-OH3.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that occupants will be exposed to excessive levels of airborne noise from elevator shafts or refuse chutes, which could lead to negative effects on the psychological well-being of persons.

*Intent 2.* To supersede the requirement stated in Sentence 9.11.2.1.(1), in situations where dwelling units are adjacent to an elevator shaft or a refuse chute.

*Intent 3.* To direct Code users to:

- Subsection 9.11.1., which refers to standardized methods of establishing the sound transmission class ratings of wall, floor and ceiling assemblies, and
- a series of tables in A-9.10.3.1., which list the sound transmission class ratings assigned to a selection of wall, floor and ceiling assemblies.

### **Provision: 9.12.1.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40, F41, F20-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that organic material will remain under buildings, which could harbour insects or vermin, or decompose and release gases, spores and other contaminants, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To limit the probability that soil will have an inadequate bearing capacity, which could lead to the cracking of concrete or asphalt that is used as ground cover in unheated crawl spaces, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.12.1.1.(2)**

---

**Objective**

OS2

**Attributions**

[F81-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of termite infestation, which could lead compromised structural integrity. This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F81-OP2.3, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of termite infestation, which could lead compromised structural integrity. This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F81-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of termite infestation, which could lead compromised structural integrity. For environmental separators or elements protected by environmental separators, this is to limit the probability of the excessive movement or deformation of walls, which could lead to:

- the excessive deformation or displacement of cladding,
- compromised air barrier systems, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- condensation,
- precipitation ingress, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F81-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of termite infestation, which could lead compromised structural integrity. Where assemblies are required to provide fire resistance, this is to limit the probability of excessive movement, deformation or failure under expected loads, which could lead to compromised fire resistance of the assembly.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F81-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of termite infestation, which could lead compromised structural integrity. For floors and elements supporting floors, this is to limit the probability of excessive deflection or damage, which could lead to rough or uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

**Provision: 9.12.1.1.(3)**

**Objective**

OH1

**Attributions**

[F20, F21, F40, F41-OH1.1] [F20, F21-OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that organic material will decompose beneath foundations, which could lead to soil having an inadequate bearing capacity, which could lead to the undue subsidence of soil under footings, which could lead to the cracking of foundations or the deformation of building super-structures.

For environmental separators or elements supporting an environmental separator, this is to limit the probability of:

- condensation,
- precipitation ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of foundation walls that act as environmental separators or of elements supported by such walls, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability that organic material under buildings will harbour insects or vermin, or decompose and release gases, spores or other contaminants, which could lead to the generation of pollutants, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Objective**

OS2

**Attributions**

[F20-OS2.2, OS2.3] [F21-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that organic material will decompose beneath foundations, which could lead to soil having an inadequate bearing capacity, which could lead to the undue subsidence of soil under footings, which could lead to the cracking of foundations or the deformation of building super-structures.

This is to limit the probability of compromised structural integrity, which could lead to:

---

## **Intent Statements: NBC 2010**

- structural failure, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F60-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of saturation of the soil beneath foundations, which could lead to the soil being unable to resist foundation loads, which could lead to excessive settlement, which could lead to structural damage to foundations and superstructures.

For elements supporting environmental separators, this is to limit the probability of:

- condensation,
- precipitation ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, drafts, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- further compromised integrity of foundation walls that act as environmental separators or of elements supported by such walls, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F60-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of saturation of the soil beneath foundations, which could lead to the soil being unable to resist foundation loads, which could lead to excessive settlement, which could lead to structural damage to foundations and superstructures.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F60-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of saturation of the soil beneath foundations, which could lead to the soil being unable to resist foundation loads, which could lead to excessive settlement, which could lead to structural damage to foundations and superstructures.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or damage, which could lead to rough or uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Provision: 9.12.1.3.(1)**

---

**Objective**

OS2

**Attributions**

[F21-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of ice lens formation beneath foundations that are installed on fine-grained soils (which can retain quite a bit of water), which could lead to the excessive vertical movement of the soil, which could lead to excessive stress on foundations, which could lead to structural damage to foundations and superstructures.

This is to limit the probability of compromised structural integrity of elements supported by foundations, which could lead to:

- an inability to support vertical building loads or lateral earth loads, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F21-OP2.3, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability of ice lens formation beneath foundations that are installed on fine-grained soils (which can retain quite a bit of water), which could lead to the excessive vertical movement of the soil, which could lead to excessive stress on foundations, which could lead to structural damage to foundations and superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of ice lens formation beneath foundations that are installed on fine-grained soils (which can retain quite a bit of water), which could lead to the excessive vertical movement of the soil, which could lead to excessive stress on foundations, which could lead to structural damage to foundations and superstructures.

For foundation walls that act as environmental separators or elements supported by such walls, this is to limit the probability of:

- condensation,
- precipitation ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F21-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of ice lens formation beneath foundations that are installed on fine-grained soils (which can retain quite a bit of water), which could lead to the excessive vertical movement of the soil, which could lead to excessive stress on foundations, which could lead to structural damage to foundations and superstructures.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F21-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of ice lens formation beneath foundations that are installed on fine-grained soils (which can retain quite a bit of water), which could lead to the excessive vertical movement of the soil, which could lead to excessive stress on foundations, which could lead to structural damage to foundations and superstructures.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or damage, which could lead to rough or uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Provision: 9.12.2.1.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.2, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that foundations will be installed on loose soil which has a lower bearing capacity than expected, which could lead to the undue subsidence of soil beneath foundations, which could lead to excessive stress on foundations, which could lead to structural damage to foundations and superstructures.

This is to limit the probability of compromised structural integrity of elements supported by foundations, which could lead to:

- an inability to support vertical building loads or lateral earth loads, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

[F21-OS3.1] Applies to floors, elements that support floors, and concrete steps with more than 2 risers.

**Intent(s)**

*Intent 1.* To limit the probability of:

- ice lens formation beneath the foundations of regularly occupied buildings, which could lead to the displacement of foundation elements, or
- the displacement of relatively massive concrete steps due to frost.

This is to limit the probability of:

- for floors and elements supporting floors, excessive deflection or damage, which could lead to rough or uneven floor surfaces, or
- for concrete steps with more than 2 risers, the steps becoming cracked or sloped, which could lead to rough or uneven surfaces.

This is to limit the probability of persons tripping or falling, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F21-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of:

- ice lens formation beneath the foundations of regularly occupied buildings, which could lead to the displacement of foundation elements, or
- the displacement of relatively massive concrete steps due to frost.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Provision: 9.12.2.2.(2)**

---

**Intent(s)**

*Intent 1.* To expand the application of the criteria stated in Article 9.12.2.2. to foundations that, despite being heated, lose insufficient heat to provide protection against frost-related soil movement.

---

**Provision: 9.12.2.2.(3)**

---

**Intent(s)**

*Intent 1.* To expand the application of Sentences 9.12.2.2.(1), 9.12.2.2.(2) and 9.12.2.2.(5) to include exterior concrete steps that have more than 2 risers, where soil movement could cause misalignment and tipping.

---

**Provision: 9.12.2.2.(4)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To clarify that there are no requirements for stairs with one or two risers to have a foundation.

---

### **Provision: 9.12.2.2.(5)**

#### **Intent(s)**

*Intent 1.* To supersede the requirements stated in Article 9.12.2.2. regarding the minimum depths of foundations, where such depths are unnecessary due to soil conditions or foundation design.

---

### **Provision: 9.12.2.2.(6)**

#### **Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.12.2.2.(1), which requires foundations to extend below the depth of frost penetration,

- buildings for which surface foundations are suitable, and
- small buildings that are not usually occupied and that represent little or no hazard to persons should they experience structural failure.

---

### **Provision: 9.12.2.2.(7)**

#### **Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.12.2.2.(1), which requires foundations to extend below the depth of frost penetration, decks and similar accessible exterior platforms, on the basis that movement will not present a significant safety hazard or compromise the performance of other constructions.

---

### **Provision: 9.12.2.2.(8)**

#### **Objective**

OS2

#### **Attributions**

[F21-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate access to surface foundations, which could compromise re-leveling of the construction, which could lead to deterioration, which could lead to structural failure.

---

#### **Objective**

OP2

#### **Attributions**

[F21-OP2.3, OP2.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate access to surface foundations, which could compromise re-leveling of the construction, which could lead to:

- deterioration, which could lead to damage to the building, or

- excessive movement, deflection or vibration, which could lead to unsuitability of the space for its intended use.

---

**Objective**

OS3

**Attributions**

[F21-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate access to surface foundations, which could compromise re-leveling of the construction, which could lead to the displacement or deformation of the supported structure, which could lead to persons losing their balance, tripping or falling under normal use, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F21-OH4]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate access to surface foundations, which could compromise re-leveling of the construction, which could lead to excessive movement, deflection or vibration, which could lead to compromised psychological well-being of persons.

---

**Provision: 9.12.3.1.(1)**

---

**Objective**

OS2

**Attributions**

[F81-OS2.1]

[F81-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that improperly placed backfill will lead to damage or displacement of foundation elements.

This is to limit the probability of compromised structural integrity of elements supported by foundations, which could lead to:

- an inability to support vertical building loads or lateral earth loads, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

[F81-OP2.1]

[F22-OP2.4]

[F81-OP2.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability that improperly placed backfill will lead to damage or displacement of foundation elements.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F81-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that improperly placed backfill will lead to:

- damage to the foundation's moisture-control elements,
- the cracking of foundation walls, or
- damage to externally-applied thermal insulation.

For environmental separators or elements supporting an environmental separator, this is to limit the probability of:

- pollutant ingress from the exterior or from adjacent interior spaces, including soil gas, combustion products from parking garages, or particulates,
- condensation,
- precipitation ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of the foundation or of elements supported or protected by the foundation, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that improperly placed backfill will lead to damage or displacement of foundation elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability that improperly placed backfill will lead to damage or displacement of foundation elements.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- persons losing their balance, tripping or falling, or
- compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

**Provision: 9.12.3.2.(1)**

---

**Objective**

OH1

**Attributions**

[F60, F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the ingress of surface water through cracks or other anomalies in foundation walls, or of overloading perimeter drain tiles.

This is to limit the probability of:

- condensation,
- precipitation ingress,

---

## **Intent Statements: NBC 2010**

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- movement or cracking of foundation walls, or
- damage to a foundation's moisture-control elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or damage, which could lead to rough or uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.12.4.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive soil settlement beneath foundation footings, which could lead to:

- structural damage to foundations or damage to foundations' moisture-control elements, or
- where settlement occurs at water-service locations, the rupture of water lines, which could lead to leakage and undermining of the foundation, which could lead to the structural failure of foundations and superstructures.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F21-OS2.1]

[F21-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive soil settlement beneath foundation footings, which could lead to:

- structural damage to foundations or damage to foundations' moisture-control elements, or
- where settlement occurs at water-service locations, the rupture of water lines, which could lead to leakage and undermining of the foundation, which could lead to the structural failure of foundations and superstructures.

This is to limit the probability of compromised structural integrity of elements supported by foundations, which could lead to:

- an inability to support vertical building loads or lateral earth loads, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F21-OP2.2]

[F21-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive soil settlement beneath foundation footings, which could lead to:

- structural damage to foundations or damage to foundations' moisture-control elements, or
- where settlement occurs at water-service locations, the rupture of water lines, which could lead to leakage and undermining of the foundation, which could lead to the structural failure of foundations and superstructures.

At sewer-line and water-service locations, this is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH2

**Attributions**

[F21-OH2.1] Applies to sewer-line locations beneath footings.

**Intent(s)**

*Intent 1.* To limit the probability of excessive soil settlement beneath foundation footings, which could lead to:

- structural damage to foundations or damage to foundations' moisture-control elements, or
- where settlement occurs at water-service locations, the rupture of water lines, which could lead to leakage and undermining of the foundation, which could lead to the structural failure of foundations and superstructures.

At sewer-line locations, this is to limit the probability of unsanitary conditions, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F21-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive soil settlement beneath foundation footings, which could lead to:

- structural damage to foundations or damage to foundations' moisture-control elements, or
- where settlement occurs at water-service locations, the rupture of water lines, which could lead to leakage and undermining of the foundation, which could lead to the structural failure of foundations and superstructures.

For floors and elements supporting floors at sewer-line and water-service locations, this is to limit the probability of excessive deflection or damage, which could lead to rough or uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.13.1.1.(1)**

### **Intent(s)**

*Intent 1.* To state the scope and application of Section 9.13.

---

### **Provision: 9.13.2.1.(1)**

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of the walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of elements supported or protected by foundation walls, which could lead to harm to persons.

---

**Provision: 9.13.2.1.(2)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported by the floors-on-ground.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of floors or of elements protected by floors, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.13.2.1.(3)**

---

#### **Intent(s)**

*Intent 1.* To exempt certain floors from the application of Sentence 9.13.2.1.(2), where:

- the ingress of moisture that is not under hydrostatic pressure will not adversely affect health or safety owing to
  - the high air leakage rate of the floors, which rapidly removes moisture from the space, or
  - the typically short duration of the presence of occupants, or
- other actions are taken to limit the ingress of moisture.

### **Provision: 9.13.2.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40-OH1.1] Applies to materials installed to control the ingress of soil gas.

[F61-OH1.1, OH1.2, OH1.3] Applies to materials installed to control the ingress of moisture.

#### **Intent(s)**

*Intent 1.* To limit the probability that:

- the performance of bituminous dampproofing materials will fall significantly below expectations with respect to moisture transfer resistance and airtightness in the case of walls, and
- the performance of polyethylene used as dampproofing will fall significantly below expectations with respect to
  - moisture transfer resistance, or
  - strength, flexibility, and resistance to tearing, puncturing, oxidation or ultraviolet radiation, which could lead to damage during installation.

This is to limit the probability of:

- an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, or
- for walls, inadequate airtightness, which could lead to moisture and soil gas ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of elements supported or protected by floors, foundation walls or roofs of underground structures, or
- the ingress of soil gas.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that:

- the performance of bituminous dampproofing materials will fall significantly below expectations with respect to moisture transfer resistance, or
- the performance of polyethylene used as dampproofing will fall significantly below expectations with respect to
  - moisture transfer resistance, or
  - strength, flexibility, and resistance to tearing, puncturing, oxidation or ultraviolet radiation, which could lead to damage during installation.

This is to limit the probability of an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of elements supported or protected by foundation walls or floors, which could lead to harm to persons.

---

**Provision: 9.13.2.3.(1)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1] Applies to materials installed to control the ingress of soil gas.

[F61-OH1.1, OH1.2, OH1.3] Applies to materials installed to control the ingress of moisture.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of installed bituminous materials will fall significantly below expectations with respect to moisture transfer resistance and airtightness in the case of walls.

This is to limit the probability of:

- an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, or
- for walls, inadequate airtightness, which could lead to moisture and soil gas ingress.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of elements supported or protected by floors, foundation walls or roofs of underground structures, or
- the ingress of soil gas.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,

---

## **Intent Statements: NBC 2010**

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of installed bituminous materials will fall significantly below expectations with respect to moisture transfer resistance.

This is to limit the probability of an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of elements supported or protected by foundation walls or floors, which could lead to harm to persons.

---

## **Provision: 9.13.2.4.(1)**

---

### **Objective**

OH1

### **Attributions**

[F40-OH1.1] Applies to dampproofing installed to control the ingress of soil gas.

[F61-OH1.1, OH1.2, OH1.3] Applies to dampproofing installed to control the ingress of moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the damp-proofing, which could lead to an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of the walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* Where dampproofing materials are installed to control the infiltration of soil gas, to limit the probability of an inadequate substrate, which could lead to discontinuity in the dampproofing, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 3.* To expand the application of Subsection 9.20.3. to include parging on masonry below ground that is used as a dampproofing substrate.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the damp-proofing, which could lead to an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of elements supported or protected by the walls, which could lead to harm to persons.

*Intent 2.* To expand the application of Subsection 9.20.3. to include parging on masonry below ground that is used as a dampproofing substrate.

---

**Provision: 9.13.2.4.(2)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1] Applies to *foundation* walls where the dampproofing serves to control the ingress of *soil* gas.

[F61-OH1.1, OH1.2, OH1.3] Applies where the dampproofing serves to control the ingress of moisture.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the damp-proofing, which could lead to an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of the walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons

*Intent 2.* Where dampproofing materials are installed to control the infiltration of soil gas, to limit the probability of an inadequate substrate, which could lead to discontinuity in the dampproofing, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the damp-proofing, which could lead to an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, not under hydrostatic pressure, which could lead to deterioration, which could lead to compromised structural integrity of elements supported or protected by the walls, which could lead to harm to persons.

---

### **Provision: 9.13.2.4.(3)**

#### **Objective**

OH1

#### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

[F40-OH1.1] Applies where dampproofing materials are installed to control the infiltration of soil gas.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the damp-proofing, which could lead to an inadequate resistance to moisture transfer from the ground.

This is to limit the probability of:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of the walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* Where dampproofing materials are installed to control the infiltration of soil gas, to limit the probability of an inadequate substrate, which could lead to discontinuity in the dampproofing, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F61-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the damp-proofing, which could lead to an inadequate resistance to moisture transfer from the ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could

lead to compromised structural integrity of elements supported or protected by the walls, which could lead to harm to persons.

**Provision: 9.13.2.5.(1)**

---

**Objective**

OH1

**Attributions**

[F40-OH1.1] Applies to dampproofing installed to control the ingress of soil gas.

[F61-OH1.1, OH1.2, OH1.3] Applies to dampproofing installed to control the ingress of moisture.

**Intent(s)**

*Intent 1.* To limit the probability of the ingress of moisture from the ground, not under hydrostatic pressure.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of the walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons

*Intent 2.* Where dampproofing materials are installed to control the infiltration of soil gas, to limit the probability of the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the ingress of moisture from the ground, not under hydrostatic pressure, which could lead to deterioration, which could lead to compromised structural integrity of elements supported or protected by the walls, which could lead to harm to persons.

**Provision: 9.13.2.6.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2]

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of the transfer of moisture from the ground through footings or walls, or the transfer of construction moisture from the wall, into interior finishes or wood members.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of interior finishes or wood members, or of elements supported or protected by interior finishes or wood members.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the transfer of moisture from the ground through footings or walls, or the transfer of construction moisture from the wall, into interior finishes or wood members, which could lead to deterioration, which could lead to compromised structural integrity of interior finishes or wood members, which could lead to structural failure, which could lead to harm to persons.

---

## **Provision: 9.13.2.6.(2)**

---

### **Intent(s)**

*Intent 1.* To clarify that the membranes and coatings used for protection of interior dampproofing required by Sentence 9.13.2.6.(1) must only cover the below-ground portion of foundation walls.

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of moisture becoming trapped between the moisture protection of interior finishes and other low-permeance materials placed inboard of that protection.

This is to limit the probability of:

- water accumulation or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements inboard of the moisture protection of interior finishes.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of moisture becoming trapped between the moisture protection of interior finishes and other low-permeance materials placed inboard of that protection, which could lead to deterioration, which could lead to compromised structural integrity of elements inboard of the moisture protection of interior finishes, which could lead to structural failure, which could lead to harm to persons.

---

**Provision: 9.13.2.6.(3)**

---

**Objective**

OH1

**Attributions**

[F61, F80-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate insulation, moisture protection and vapour diffusion protection of interior spaces, which could lead to:

- water accumulation,
- condensation,
- compromised thermal performance of components intended to provide resistance to heat transfer, or
- premature failure of the moisture protection.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of assemblies acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To clarify that insulation fulfilling the functions of the protection of interior finishes from moisture and that of the vapour barrier must cover the entire foundation wall.

---

**Objective**

OS2

**Attributions**

[F61, F80-OS2.3]

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate insulation, moisture protection and vapour diffusion protection of interior spaces, which could lead to:

- water accumulation,
- condensation,
- compromised thermal performance of components intended to provide resistance to heat transfer, or
- premature failure of the moisture protection.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of elements inboard of the moisture protection of interior finishes, which could lead to structural failure of such elements, which could lead to harm to persons.

---

### **Intent(s)**

*Intent 1.* To clarify that insulation fulfilling the functions of the protection of interior finishes from moisture and that of the vapour barrier must cover the entire foundation wall.

### **Provision: 9.13.2.7.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of damage to dampproofing.

This is to limit the probability of:

- the ingress of moisture from the ground, not under hydrostatic pressure, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of floors or of elements protected by floors.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

*Intent 1.* To limit the probability of an inadequate resistance to water from the ground, under hydrostatic pressure, which could lead to:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported or protected by floors-on-ground or foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to water from the ground, under hydrostatic pressure, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of floors or of elements protected or supported by floors-on-ground or foundation walls, which could lead to harm to persons.

---

### **Provision: 9.13.3.1.(2)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance of underground roofs to water.

This is to limit the probability of:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by underground roofs.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance of underground roofs to water, which could lead to water ingress, which could lead to deterioration, which could lead to compromised structural integrity of roofs or of elements protected by roofs, which could lead to harm to persons.

**Provision: 9.13.3.2.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of bituminous waterproofing materials will fall significantly below expectations.

This is to limit the probability of:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported or protected by floors-on-ground, foundation walls or roofs of underground structures.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

[F40-OH1.1] Applies where waterproofing materials are installed to control the infiltration of soil gas.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the waterproofing, which could lead to:

- the ingress of moisture from the ground, including water that is under hydrostatic pressure, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of walls or of elements protected by the walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons

*Intent 2.* To expand the application of Subsection 9.20.3. to include parging on masonry below ground that is applied as a substrate for waterproofing.

*Intent 3.* Where waterproofing materials are installed to control the infiltration of soil gas, to limit the probability of an inadequate substrate, which could lead to discontinuity in the waterproofing, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate substrate, which could lead to discontinuity in the waterproofing, which could lead to the ingress of moisture from the ground, including water that is under hydrostatic pressure, which could lead to deterioration, which could lead to compromised structural integrity of elements protected by such walls, which could lead to harm to persons.

*Intent 2.* To expand the application of Subsection 9.20.3. to include parging on masonry below ground that is applied as a substrate for waterproofing.

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity, and inadequate structural support and protection for water-resistant materials, which could lead to:

- the ingress of moisture from the ground, including water that is under hydrostatic pressure, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation, or
- deterioration, which could lead to compromised integrity of floors-on-ground or of elements protected by the floors-on-ground.

This is to limit the probability of:

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity, and inadequate structural support and protection for water-resistant materials, which could lead to the ingress of moisture from the ground, under hydrostatic pressure, which could lead to deterioration, which could lead to compromised structural integrity of floors-on-ground or of elements protected by the floors-on-ground, which could lead to harm to persons.

---

**Provision: 9.13.4.1.(1)**

**Intent(s)**

*Intent 1.* To state the application of Subsection 9.13.4.

---

**Provision: 9.13.4.1.(2)**

**Intent(s)**

*Intent 1.* To state the scope of Subsection 9.13.4.

---

**Provision: 9.13.4.2.(1)**

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.25.3.

---

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Provision: 9.13.4.2.(2)**

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the remediation of high indoor radon concentration is unnecessarily difficult and costly after construction of the building is complete, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To direct Code users to Article 9.13.4.3..

---

**Provision: 9.13.4.2.(3)**

**Attributions**

[F40-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of that the remediation of high indoor radon concentration is unnecessarily difficult and costly after the construction of the building is complete, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To direct Code users to Article 9.13.4.3.

*Intent 3.* To expand the application of Articles 5.4.1.1. and 6.2.1.1. to include the design and construction of radon mitigation systems for buildings where single-point subfloor depressurization systems may not be sufficient to address high indoor concentrations of radon.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.13.4.3.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F40-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that radon cannot be extracted from between the air barrier and the ground, which could lead to high concentrations of radon inside buildings, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* To state the application of Sentences 9.13.4.3.(2) and 9.13.4.3.(3).

### **Provision: 9.13.4.3.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F40-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that:

- components of a future system for the remediation of high indoor radon concentration will be located inappropriately or be inaccessible for the future installation of exhaust equipment, which could lead to a very difficult and costly installation of connections to the gas-permeable layer,
- the layer beneath the air barrier cannot be depressurized, or
- the connections to a future system for the remediation of high indoor radon concentration:
  - will be used for purposes other than radon extraction,
  - will not be installed, which could lead to the installation of connections in the future being very difficult or costly, and
  - will not be adequately labelled, which could lead to the connections accidentally being opened or used for other purposes.

This is to limit the probability that radon cannot be extracted from all spaces between the air barrier and the ground, which could lead to high concentrations of radon inside buildings, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Subclause 9.13.4.3.(2)(c)(ii)] To limit the probability that components of a future system for the remediation of high indoor radon concentration can bypass the air barrier system or that airtight seals will be removed, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

### **Provision: 9.13.4.3.(3)**

---

#### **Objective**

OH1

#### **Attributions**

[F40-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability that:

- the properties of the granular material will be inadequate,
- the location, size and configuration of radon extraction pipes will be inadequate,
- the pipe opening within the gravel will be blocked,
- the airtight seal will not be provided or will be inadequate, or
- the pipes will be used for purposes other than radon extraction.

This is to limit the probability that:

- depressurization of the space between the air barrier and the ground will be ineffective, and
- radon will enter the conditioned space of a building.

This is to limit the probability of high concentrations of radon inside buildings, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

*Intent 2.* [Clause 9.13.4.3.(3)(a)] To direct Code users to Sentence 9.16.2.1.(1) for requirements regarding the installation of granular material below floors-on-ground.

---

**Provision: 9.14.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.14.

---

**Provision: 9.14.1.2.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.18., which contains drainage requirements regarding crawl spaces.

---

**Provision: 9.14.1.3.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.16., which contains requirements regarding drainage beneath floors-on-ground.

---

**Provision: 9.14.2.1.(1)**

---

**Objective**

OH1

**Attributions**

[F60-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessive moisture loading, including hydrostatic pressure, on foundation walls and basement floors.

This is to limit the probability of:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by the environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F60-OS2.1, OS2.2, OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of excessive moisture loading, including hydrostatic pressure, on foundation walls and basement floors.

This is to limit the probability of water ingress, which could lead to:

- compromised structural integrity of foundation walls or basement floors, or of elements supported by the walls or floors, or
- deterioration, which could lead to compromised integrity of elements supported or protected by exterior foundation walls.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of excessive moisture loading on the soil immediately beneath the footings, which could lead to saturation and a reduction in the soil's bearing pressure, which could lead to compromised integrity of supporting soils, which could lead to failure of the foundation, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F60-OP2.1, OP2.2, OP2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of excessive moisture loading, including hydrostatic pressure, on foundation walls and basement floors.

This is to limit the probability of water ingress, which could lead to:

- compromised structural integrity of foundation walls or basement floors, or of elements supported by the walls or floors, or
- deterioration, which could lead to compromised integrity of elements supported or protected by exterior foundation walls.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

**Intent 2.** To limit the probability of excessive moisture loading on the soil immediately beneath the footings, which could lead to saturation and a reduction in the soil's bearing pressure, which could lead to compromised integrity of supporting soils, which could lead to failure of the foundation, which could lead to damage to the building.

---

**Provision: 9.14.2.1.(2)**

---

**Objective**

OH1

**Attributions**

9.14.2.1.(2)(a) [F60-OH1.1, OH1.2, OH1.3] Applies where *foundations* serve as or support an environmental separator.

**Intent(s)**

**Intent 1.** To limit the probability of inadequate drainage, which could lead to a perched water table, which could lead to the accumulation of water under hydrostatic pressure, which could lead to excessive moisture loading on foundation walls.

This is to limit the probability of:

- the ingress of moisture from the ground, or
- movement or cracking of the foundation wall or building superstructures, which could lead to, for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- excessive heat transfer,
- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation, or
- moisture ingress from the ground.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported by foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

9.14.2.1.(2)(a) [F60-OS2.1]

9.14.2.1.(2)(a) [F60-OS2.3] Applies where *foundations* serve as or support an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage, which could lead to a perched water table, which could lead to the accumulation of water under hydrostatic pressure, which could lead to excessive moisture loading on foundation walls.

This is to limit the probability of:

- water ingress, or
- excessive lateral loading on foundation walls, which could lead to the movement or cracking of foundations or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

9.14.2.1.(2)(b) [F21-OS2.1]

9.14.2.1.(2)(b) [F21-OS2.3] Applies where *foundations* serve as or support an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive lateral loading on foundation walls, which could lead to the movement or cracking of foundation walls or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

### **Objective**

OP2

### **Attributions**

9.14.2.1.(2)(b) [F21-OP2.1]

9.14.2.1.(2)(b) [F21-OP2.3] Applies where *foundations* serve as or support an environmental separator.

9.14.2.1.(2)(b) [F21-OP2.4] Applies where *foundations* support walls or floors.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive lateral loading on foundation walls, which could lead to the movement or cracking of foundation walls or building superstructures.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to further compromised structural integrity, or
- an inability to resist expected loads, which could lead to

- the excessive deformation or deflection of walls, or
- the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

9.14.2.1.(2)(b) [F21-OH1.1, OH1.2, OH1.3] Applies where *foundations* serve as or support an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive lateral loading on foundation walls, which could lead to the movement or cracking of the foundation walls or building superstructures.

This is to limit the probability of:

- excessive heat transfer,
- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation, or
- moisture ingress from the ground.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported by foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

9.14.2.1.(2)(b) [F21-OH4] Applies where *foundations* support floors or elements supporting floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive lateral loading on foundation walls, which could lead to the movement or cracking of foundation walls or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or

---

## Intent Statements: NBC 2010

- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

### Objective

OS3

### Attributions

9.14.2.1.(2)(b) [F21-OS3.1] Applies where *foundations* support floors or elements supporting floors.

9.14.2.1.(2)(b) [F21-OS3.7] Applies where *foundations* support walls that contain windows or doors required for emergency egress.

### Intent(s)

*Intent 1.* To limit the probability of excessive lateral loading on foundation walls, which could lead to the movement or cracking of foundation walls or building superstructures.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or vibration, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

---

### Provision: 9.14.3.1.(1)

---

### Objective

OH1

### Attributions

[F60-OH1.1, OH1.2, OH1.3]

### Intent(s)

*Intent 1.* To limit the probability that the performance of drain tiles or drain pipes will fall significantly below expectations, with respect to:

- strength (e.g. tensile, compressive, impact, hydrostatic, flexural),
- resistance to deterioration (e.g. due to freeze-thaw stresses, chemical attack, corrosion),
- the integrity of connections, or
- permeance (of perforated products).

This is to limit the probability of excessive moisture loading on foundation walls and basement floors, which could lead to:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

- deterioration, which could lead to compromised integrity of elements protected by the environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F60-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that the performance of drain tiles or drain pipes will fall significantly below expectations, with respect to:

- strength (e.g. tensile, compressive, impact, hydrostatic, flexural),
- resistance to deterioration (e.g. due to freeze-thaw stresses, chemical attack, corrosion),
- the integrity of connections, or
- permeance (of perforated products).

This is to limit the probability of excessive moisture loading on foundation walls and basement floors.

This is to limit the probability of the ingress of moisture from the ground, which could lead to:

- compromised structural integrity of foundation walls and basement floors, or of elements supported by the walls or floors, or
- deterioration, which could lead to compromised integrity of elements supported or protected by exterior foundation walls.

This is to limit the probability of harm to persons.

OS2

**Attributions**

9.14.4.1.(1)(b) [F21-OS2.1]

9.14.4.1.(1)(b) [F21-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that weathering of pyritic material will lead to excessive loading on foundation walls, under lateral soil pressure, with attendant structural damage to the foundation and superstructure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting environmental separators, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

9.14.4.1.(1)(b) [F21-OP2.1, OP2.4]

9.14.4.1.(1)(b) [F21-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that weathering of pyritic material will lead to excessive loading on foundation walls, under lateral soil pressure, with attendant structural damage to the foundation and superstructure.

This is to limit the probability of:

- compromised structural integrity of the foundation or supported elements, or
- where the foundation serves as or supports an environmental separator, compromised environmental separation elements, which could lead to condensation, rainwater ingress or the ingress of moisture from the ground, which could lead to deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OH1

**Attributions**

9.14.4.1.(1)(b) [F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that weathering of pyritic material will lead to excessive loading on foundation walls, under lateral soil pressure, with attendant structural damage to the foundation and superstructure.

For elements serving as an environmental separator or supporting an environmental separator, this is to limit the probability of:

- pollutant ingress (from the exterior or from adjacent interior space, including soil gas, combustion products from parking garages, and particulates),
- precipitation ingress,
- condensation, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported by foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

9.14.4.1.(1)(b) [F21-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that weathering of pyritic material will lead to excessive loading on foundation walls, under lateral soil pressure, with attendant structural damage to the foundation and superstructure.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

9.14.4.1.(1)(b) [F21-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that weathering of pyritic material will lead to excessive loading on foundation walls, under lateral soil pressure, with attendant structural damage to the foundation and superstructure.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or damage, which could lead to rough or uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

**Provision: 9.14.4.2.(1)**

**Objective**

OH1

**Attributions**

[F60-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- a reversal of the slope leading to the sump pit,
- depressions that collect water,
- the contamination of granular layers by fines,
- inadequate percolation and drainage capacity close to foundations, or
- saturation and a reduction in the soil's bearing capacity.

This is to limit the probability of excessive moisture loading on foundation walls and basement floors, which could lead to:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by the environmental separators.

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by the environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F60-OS2.1, OS2.2, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage capacity, which could lead to excessive moisture loading on foundation walls and basement floors.

This is to limit the probability of the accumulation of water under hydrostatic pressure, which could lead to:

- compromised structural integrity of foundation walls and basement floors, or of elements supported by the walls or floors, or
- deterioration, which could lead to compromised integrity of elements supported or protected by exterior foundation walls.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of excessive moisture loading on the soil immediately beneath the footings, which could lead to saturation and a reduction in the soil's bearing capacity, which could lead to the failure of foundation walls and basement floors, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F60-OP2.1, OP2.2, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage capacity, which could lead to excessive moisture loading on foundation walls and basement floors.

This is to limit the probability of the accumulation of water under hydrostatic pressure, which could lead to:

- compromised structural integrity of foundation walls and basement floors, or of elements supported by the walls or floors, or
- deterioration, which could lead to compromised integrity of elements supported or protected by exterior foundation walls.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

*Intent 2.* To limit the probability of excessive moisture loading on the soil immediately beneath the footings, which could lead to saturation and a reduction in the soil's bearing capacity, which could lead to the failure of foundation walls and basement floors, which could lead to damage to the building.

[F61-OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate drainage of water from driveways where water can accumulate or enter a garage.

This is to limit the probability of:

- the exposure of building materials to water, or
- moisture-related expansion and contraction of the soil, or frost heaving.

This is to limit the probability of:

- compromised structural integrity of garage foundations and floors, or of elements they support, or
- deterioration, which could lead to compromised integrity of elements supported or protected by garage foundation or floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OS3

**Attributions**

[F61-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of the inadequate drainage of water from driveways, which could lead to the ingress of water into garages, which could lead to accelerated deterioration due to freeze-thaw stresses, which could lead to rough or uneven floor surfaces, which could lead to persons tripping, which could lead to harm to persons.

**Provision: 9.14.6.5.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.26., which contains requirements regarding downspouts.

**Provision: 9.15.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.15.

**Provision: 9.15.1.1.(2)**

---

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the application of Section 9.15. and expand the application of Part 4 to the design of foundations that are beyond the application of Section 9.15., based on bearing pressures, load distribution and design capacities specified in Subsection 9.4.4.

---

### **Provision: 9.15.1.2.(1)**

### **Intent(s)**

*Intent 1.* To limit the application of Section 9.15. and expand the application of Part 4 to the design of foundations for Part 9 buildings that are erected on permafrost.

---

### **Provision: 9.15.1.3.(1)**

### **Objective**

OS2

### **Attributions**

[F20-OS2.2]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of detached buildings, with respect to longitudinal or torsional stiffness, will fall significantly below expectations, which could lead to an inability to resist expected loads transferred from the superstructure to individual foundation elements.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.2]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of detached buildings, with respect to longitudinal or torsional stiffness, will fall significantly below expectations, which could lead to an inability to resist expected loads transferred from the superstructure to individual foundation elements.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or

- the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of detached buildings, with respect to longitudinal or torsional stiffness, will fall significantly below expectations, which could lead to an inability to resist expected loads transferred from the superstructure to individual foundation elements.

Where elements support or are part of an environmental separator, this is to limit the probability of excessive deformation, which could lead to damage to the superstructure, which could lead to:

- condensation,
- rainwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of the environmental separator, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of detached buildings, with respect to longitudinal or torsional stiffness, will fall significantly below expectations, which could lead to an inability to resist expected loads transferred from the superstructure to individual foundation elements.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

---

## **Intent Statements: NBC 2010**

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

### **Objective**

OS3

### **Attributions**

[F22-OS3.1] Applies to floors and elements that support floors.

[F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of detached buildings, with respect to longitudinal or torsional stiffness, will fall significantly below expectations, which could lead to an inability to resist expected loads transferred from the superstructure to individual foundation elements.

This is to limit the probability of:

- compromised structural integrity,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- for floors and elements that support floors, rough or uneven walking surfaces, which could lead to persons losing their balance, tripping or falling, or
- compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

## **Provision: 9.15.2.1.(1)**

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.3., which contains requirements regarding concrete.

---

## **Provision: 9.15.2.2.(1)**

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20, F21, F61-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that concrete block of inadequate compressive strength will be used, which could lead to:

- an inadequate resistance to water absorption, which could lead to excessive water absorption, which could lead to blocks cracking due to freeze-thaw stresses, or
- an inability to support loads, which could lead to blocks cracking.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

**Attributions**

[F20, F21, F61-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that concrete block of inadequate compressive strength will be used, which could lead to:

- an inadequate resistance to water absorption, which could lead to excessive water absorption, which could lead to blocks cracking due to freeze-thaw stresses, or
- an inability to support loads, which could lead to blocks cracking.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to rough or uneven walking surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F21, F61-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that concrete block of inadequate compressive strength will be used, which could lead to:

- an inadequate resistance to water absorption, which could lead to excessive water absorption, which could lead to blocks cracking due to freeze-thaw stresses, or
- an inability to support loads, which could lead to blocks cracking.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F21, F61-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that concrete block of inadequate compressive strength will be used, which could lead to:

- an inadequate resistance to water absorption, which could lead to excessive water absorption, which could lead to blocks cracking due to freeze-thaw stresses, or
- an inability to support loads, which could lead to blocks cracking.

Where elements support or are part of an environmental separator, this is to limit the probability of damage to the foundation and the superstructure, which could lead to:

- condensation,
- rainwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of the environmental separator, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

[F21, F61-OP2.4]

[F20, F21, F61-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that concrete block of inadequate compressive strength will be used, which could lead to:

- an inadequate resistance to water absorption, which could lead to excessive water absorption, which could lead to blocks cracking due to freeze-thaw stresses, or
- an inability to support loads, which could lead to blocks cracking.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,

- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Provision: 9.15.2.2.(2)**

**Intent(s)**

*Intent 1.* To expand the application of Section 9.20. to mortar, grout, mortar joints, corbelling and protection for unit masonry for masonry in contact with the ground.

---

**Provision: 9.15.2.2.(3)**

**Objective**

OS2

**Attributions**

9.15.2.2.(3)(a) [F20-OS2.1]

9.15.2.2.(3)(a) [F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the use of inappropriate or substandard mortar will lead to cracking at mortar joints and inadequate bonding to masonry units, which could lead to the inadequate performance or premature failure of concrete block foundation walls under expected environmental or structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

9.15.2.2.(3)(a) [F20-OP2.1]

9.15.2.2.(3)(a) [F80-OP2.4]

9.15.2.2.(3)(a) [F20, F80-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the use of inappropriate or substandard mortar will lead to cracking at mortar joints and inadequate bonding to masonry units, which could lead to the inadequate performance or premature failure of concrete block foundation walls under expected environmental or structural loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of piers with an excessive height-to-width ratio, which could lead to piers tilting or toppling under expected wind or seismic loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of piers with an excessive height-to-width ratio, which could lead to piers tilting or toppling under expected wind or seismic loads.

Where elements support or are part of an environmental separator, this is to limit the probability of compromised integrity of the superstructure, which could lead to:

- condensation,
- rainwater ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by piers, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and

---

## **Intent Statements: NBC 2010**

- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of piers with an excessive height-to-width ratio, which could lead to piers tilting or toppling under expected wind or seismic loads.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of piers with an excessive height-to-width ratio, which could lead to piers tilting or toppling under expected wind or seismic loads.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to rough or uneven walking surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

## **Provision: 9.15.2.3.(4)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.4]

[F22-OS2.4, OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of the inappropriate orientation of concrete blocks, which could lead to:

- piers tilting or toppling, or

- the structural failure of piers under gravity loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate orientation of concrete blocks, which could lead to:

- piers tilting or toppling, or
- the structural failure of piers under gravity loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of the inappropriate orientation of concrete blocks, which could lead to:

- piers tilting or toppling, or
- the structural failure of piers under gravity loads.

Where elements support or are part of an environmental separator, this is to limit the probability of a loss of loadbearing capacity, which could lead to compromised integrity of the superstructure.

This is to limit the probability of:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or

---

## **Intent Statements: NBC 2010**

- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water ingress and accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements supported by foundations.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of the inappropriate orientation of concrete blocks, which could lead to:

- piers tilting or toppling, or
- the structural failure of piers under gravity loads.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F21-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient bearing area for footings, which could lead to compressive failure and excessive settlement of underlying soil, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to rough or uneven walking surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

**Provision: 9.15.3.4.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.2]

[F20, F21-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient bearing area for footings, which could lead to compressive failure and excessive settlement of underlying soil, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.2]

[F21-OP2.4]

[F20, F21-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient bearing area for footings, which could lead to compressive failure and excessive settlement of underlying soil, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient bearing area for footings, which could lead to compressive failure and excessive settlement of underlying soil, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

Where elements support or are part of an environmental separator, this is to limit the probability that foundations will crack, which could lead to:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundations, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

[F20, F22-OS2.3, OS2.4]

**Intent(s)**

*Intent 1.* To limit the probability of the removal or disturbance of an excessive volume of soil from slopes, which could lead to the destabilization and failure of slopes, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or

---

## **Intent Statements: NBC 2010**

- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20, F22-OP2.3, OP2.4]

### **Intent(s)**

*Intent 1.* To limit the probability of the removal or disturbance of an excessive volume of soil from slopes, which could lead to the destabilization and failure of slopes, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies where the *foundation* supports or is part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of the removal or disturbance of an excessive volume of soil from slopes, which could lead to the destabilization and failure of slopes, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

Where elements support or are part of an environmental separator, this is to limit the probability of concrete or masonry cracking, which could lead to:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundations, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to *foundations* that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of the removal or disturbance of an excessive volume of soil from slopes, which could lead to the destabilization and failure of slopes, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to *foundations* that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of the removal or disturbance of an excessive volume of soil from slopes, which could lead to the destabilization and failure of slopes, which could lead to structural damage to the foundation and the building, which could lead to an inability to support vertical building loads or lateral earth loads.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to persons tripping or falling, which could lead to harm to persons.

---

---

#### **Objective**

OH1

#### **Attributions**

[F22, F63, F55-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of form material for use in flat insulating concrete form foundation walls will fall significantly below expectations, which could lead to:

- the dislodgement or failure of form material,
- the excessive sagging and misalignment or opening of joints,
- excessively low temperatures of interior surfaces or within assemblies, or
- an inadequate resistance to air and moisture transfer.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundations, which could lead to the deterioration of building elements.

This is to limit the probability of:

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the block wall will be insufficiently stiff and strong at critical edges and openings, which could lead to an inability to resist transverse or vertical loads, which could lead to the cracking or displacement of foundation walls.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to rough or uneven walking surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Provision: 9.15.4.2.(7)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3] [F22-OS2.3, OS2.4]

**Intent(s)**

*Intent 1.* To limit the probability that the vertical bar reinforcement will not be adequately encased and bonded to the concrete, or of excessive eccentricity of load resistance, which could lead to the cracking or displacement of foundation walls.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.3] [F22-OP2.3, OP2.4]

### **Intent(s)**

*Intent 1.* To limit the probability that the vertical bar reinforcement will not be adequately encased and bonded to the concrete, or of excessive eccentricity of load resistance, which could lead to the cracking or displacement of foundation walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability that the vertical bar reinforcement will not be adequately encased and bonded to the concrete, or of excessive eccentricity of load resistance, which could lead to the cracking or displacement of foundation walls.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundations, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the vertical bar reinforcement will not be adequately encased and bonded to the concrete, or of excessive eccentricity of load resistance, which could lead to the cracking or displacement of foundation walls.

This is to limit the probability of:

**Provision: 9.15.4.7.(1)**

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive height or inadequate thickness of thin portions of concrete or unit masonry foundation walls, which could lead to inadequate strength, which could lead to an inability to support expected vertical loads, which could lead to structural damage to the foundation and the building.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive height or inadequate thickness of thin portions of concrete or unit masonry foundation walls, which could lead to inadequate strength, which could lead to an inability to support expected vertical loads, which could lead to structural damage to the foundation and the building.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of excessive height or inadequate thickness of thin portions of concrete or unit masonry foundation walls, which could lead to inadequate strength, which could lead to an inability to support expected vertical loads, which could lead to structural damage to the foundation and the building.

Where elements support or are part of an environmental separator, this is to limit the probability of cracking, which could lead to:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundations, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive height or inadequate thickness of thin portions of concrete or unit masonry foundation walls, which could lead to inadequate strength, which could lead to an inability to support expected vertical loads, which could lead to structural damage to the foundation and the building.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive height or inadequate thickness of thin portions of concrete or unit masonry foundation walls, which could lead to inadequate strength, which could lead to an inability to support expected vertical loads, which could lead to structural damage to the foundation and the building.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Provision: 9.15.4.7.(2)**

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate thickness or inadequate lateral support for concrete or unit masonry foundation walls, which could lead to an inability to support vertical building loads or lateral earth loads, which could lead to damage to the foundation or the superstructure.

Where elements support or are part of an environmental separator, this is to limit the probability of cracking, which could lead to:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundations, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of inadequate crack control, which could lead to random cracking of cast-in-place and concrete block foundation walls due to shrinkage or soil movement, which could lead to water ingress, which could lead to compromised structural integrity of elements supported by foundations, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F21-OP2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate crack control, which could lead to random cracking of cast-in-place and concrete block foundation walls due to shrinkage or soil movement, which could lead to water ingress, which could lead to compromised structural integrity of elements supported by foundations, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, which could lead to damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate crack control, which could lead to random cracking of cast-in-place and concrete block foundation walls due to shrinkage or soil movement.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- the ingress of water or moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.15.4.9.(2)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate watertightness of crack control joints or the relative displacement of foundation sections under lateral soil pressure, which could lead to an inability to support vertical building loads or lateral earth loads.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by foundation walls.

This is to limit the probability of:

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F80-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate protection, which could lead to beam ends being exposed to water from rain or melting snow, which could lead to rotting or corrosion of the ends of beams.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F80-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate protection, which could lead to beam ends being exposed to water from rain or melting snow, which could lead to rotting or corrosion of the ends of beams.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Provision: 9.15.5.3.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support, which could lead to an inability to resist concentrated loads from beams, which could lead to damage to the foundation or the superstructure.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support, which could lead to an inability to resist concentrated loads from beams, which could lead to damage to the foundation or the superstructure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate support, which could lead to an inability to resist concentrated loads from beams, which could lead to damage to the foundation or the superstructure.

Where elements support or are part of an environmental separator, this is to limit the probability of cracking, which could lead to:

- condensation,
- rainwater ingress,
- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- compromised integrity of elements supported by foundation walls, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support, which could lead to an inability to resist concentrated loads from beams, which could lead to damage to the foundation or the superstructure.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support, which could lead to an inability to resist concentrated loads from beams, which could lead to damage to the foundation or the superstructure.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.15.6.1.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.13., which contains requirements for dampproofing and waterproofing.

---

### **Provision: 9.15.6.2.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of excessively porous mortar between concrete blocks, which could lead to an inadequate resistance to water.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- the ingress of surface water or rainwater, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of foundation walls or elements supported or protected by foundation walls.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessively porous mortar between concrete blocks, which could lead to an inadequate resistance to water, which could lead to the ingress of surface or rainwater, which could lead to deterioration, which could lead to compromised integrity of elements supported or protected by foundations, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F61-OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of excessively porous mortar between concrete blocks, which could lead to an inadequate resistance to water, which could lead to the ingress of surface or rainwater, which could lead to deterioration, which could lead to compromised integrity of elements supported or protected by foundations, which could lead to damage to the building.

---

**Provision: 9.15.6.3.(1)**

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity in dampproofing and waterproofing materials at form ties, which could lead to an inadequate resistance to water.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- the ingress of moisture from the ground, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by foundation walls.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F30-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability of persons coming in contact with protruding form ties, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity in dampproofing and waterproofing materials at form ties, which could lead to an inadequate resistance to water, which could lead to compromised integrity of elements supported or protected by foundations, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F61-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity in dampproofing and waterproofing materials at form ties, which could lead to an inadequate resistance to water, which could lead to compromised integrity of elements supported or protected by foundations, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to damage to the building.

---

## **Provision: 9.16.1.1.(1)**

---

### **Intent(s)**

*Intent 1.* To state the application of Section 9.16.

---

## **Provision: 9.16.1.2.(1)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Part 4 to include certain Part 9 floors-on-ground.

---

**Provision: 9.16.1.3.(1)**

**Objective**

OS3

**Attributions**

9.16.1.3.(1)(a), 9.16.1.3.(1)(b) [F30-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability of uneven floor surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

**Objective**

OH2

**Attributions**

9.16.1.3.(1)(a), 9.16.1.3.(1)(b) [F40-OH2.4]

**Intent(s)**

*Intent 1.* To limit the probability of contact with contaminated surfaces, which could lead to harm to persons.

---

**Provision: 9.16.1.4.(1)**

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.13. which contains requirements for dampproofing and waterproofing.

---

**Provision: 9.16.2.1.(1)**

**Objective**

OH1

**Attributions**

[F40, F61-OH1.1] [F60, F61-OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate drainage layer or insufficient capillary break beneath floors-on-ground.

This to limit the probability of:

- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by floors-on-ground.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability that soil gas under floors-on-ground will not reach extraction locations, which could lead to infiltration of soil gas, particularly radon, except in buildings of industrial occupancy where the nature of processes contained therein permits or requires the year-round use of large openings in the building envelope, or in buildings constructed in areas where it can be demonstrated that soil gas does not constitute a hazard.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F60-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate drainage layer beneath floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to deterioration, which could lead to compromised structural integrity of floors-on-ground or of elements protected by floors-on-ground, which could lead to harm to persons.

---

### **Provision: 9.16.2.1.(2)**

---

### **Intent(s)**

*Intent 1.* To modify the application of Sentence 9.16.2.1.(1).

---

### **Provision: 9.16.2.2.(1)**

---

### **Objective**

OS2

### **Attributions**

[F21-OS2.1, OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that moisture-content-related soil movement or the weathering of pyritic material will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F21-OP2.1, OP2.3, OP2.4]

**Intent(s)**

*Intent 1.* To limit the probability that moisture-content-related soil movement or the weathering of pyritic material will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of damage to the building.

---

**Objective**

OH1

**Attributions**

[F21-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability that moisture-content-related soil movement or the weathering of pyritic material will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of:

- precipitation ingress,
- condensation, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by floors-on-ground.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS3

[F21-OS3.1]

**Intent(s)**

*Intent 1.* To limit the probability that moisture-content-related soil movement or the weathering of pyritic material will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of excessive deflection, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

### **Provision: 9.16.2.2.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F21-OS2.1, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that soil movement resulting from freezing of the soil will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F21-OP2.1, OP2.3, OP2.4]

#### **Intent(s)**

*Intent 1.* To limit the probability that soil movement resulting from freezing of the soil will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F21-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that soil movement resulting from freezing of the soil will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of:

- precipitation ingress,
- condensation, or
- the ingress of moisture from the ground.

This is to limit the probability of:

- an inadequate control of relative humidity or water accumulation,

---

## **Intent Statements: NBC 2010**

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by floors-on-ground.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F21-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability that soil movement resulting from freezing of the soil will lead to the heaving or subsidence of floors-on-ground, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of excessive deflection, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.16.2.2.(3)**

---

### **Objective**

OS3

### **Attributions**

[F22-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate structural support for floors-on-ground, which could lead to excessive deflection or cracking of the floor, which could lead to uneven surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.16.2.2.(4)**

---

### **Intent(s)**

*Intent 1.* To exempt clean coarse aggregate with limited amounts of fine material from having to be compacted since the compaction will not add to the structural support for floors-on-ground.

*Intent 2.* To exempt from Sentence 9.16.2.2.(3) situations where the fill material is of certain quality.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.16.3.1.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F60-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of excessive moisture loading on floors-on-ground, which could lead to:

- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of elements protected by floors-on-ground.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to hydrostatic pressure, which could lead to the failure of floors-on-ground.

This to limit the probability of:

- the ingress of moisture from the ground, or
- the compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of floors-on-ground.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F20-OS2.1] [F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to hydrostatic pressure, which could lead to:

- the failure of floors-on-ground, or
- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1] [F61-OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to hydrostatic pressure, which could lead to:

- the failure of floors-on-ground, or

---

## **Intent Statements: NBC 2010**

- the compromised structural integrity of floors-on-ground, which could lead to the ingress of moisture from the ground, which could lead to the deterioration of building elements.

This is to limit the probability of damage to the building.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to hydrostatic pressure, which could lead to the failure of floors-on-ground, which could lead to uneven walking surfaces, which could lead to persons tripping or falling, which could lead to harm to persons.

---

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that columns will be unable to resist expected gravity loads transmitted through beams, which could lead to structural failure of columns.

For columns that support exterior walls or roofs, this is to limit the probability of excessive deformation or deflection, or compromised air barrier systems, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- further compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and

---

## **Intent Statements: NBC 2010**

- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that columns will be unable to resist expected gravity loads transmitted through beams, which could lead to the structural failure of columns.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that columns will be unable to resist expected gravity loads transmitted through beams, which could lead to the structural failure of columns.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

---

## **Provision: 9.17.3.1.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that columns will be unable to resist gravity expected loads transmitted through beams, which could lead to the structural failure of columns.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or

- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

*Intent 2.* To modify the application of Sentence 9.17.3.1.(1).

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20, F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that columns will be unable to resist gravity expected loads transmitted through beams, which could lead to the structural failure of columns.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, and
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

*Intent 2.* To modify the application of Sentence 9.17.3.1.(1).

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

*Intent 2.* To modify the application of Sentence 9.17.3.1.(1).

**Provision: 9.17.3.2.(1)**

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate end bearing area, which could lead to excessive localised stress, which could lead to:

- crushing of concrete at the base of the footing (or of wood at the top, where a column supports a wood beam), or
- shear failure of wood beams (parallel to the grain), which could lead to the structural failure of beams.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20, F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate end bearing area, which could lead to excessive localised stress, which could lead to:

- crushing of concrete at the base of the footing (or of wood at the top, where a column supports a wood beam), or

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.17.3.2.(2)**

---

**Intent(s)**

*Intent 1.* To exempt from the application of Sentence 9.17.3.2.(1) columns supporting steel beams, where lateral support for the top of the column top [see Sentence 9.17.2.2.(1)] is achieved in another way.

---

**Provision: 9.17.3.3.(1)**

---

**Objective**

OS3

**Attributions**

[F80-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* For columns exposed to the weather, to limit the probability that the columns will rust at an excessive rate, which could lead to the premature failure of the columns.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

---

## **Intent Statements: NBC 2010**

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F80-OS2.3]

### **Intent(s)**

*Intent 1.* For columns exposed to the weather, to limit the probability that the columns will rust at an excessive rate, which could lead to the premature failure of the columns.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F80-OP2.3, OP2.4]

### **Intent(s)**

*Intent 1.* For columns exposed to the weather, to limit the probability that the columns will rust at an excessive rate, which could lead to the premature failure of the columns.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, and
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F80-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* For columns exposed to the weather that support exterior walls or roofs, to limit the probability that the columns will rust at an excessive rate, which could lead to the premature failure of the columns

For columns that support exterior walls or roofs, this is to limit the probability of excessive deformation or deflection, or compromised air barrier systems, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- further compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F80-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* For columns exposed to the weather, to limit the probability that the columns will rust at an excessive rate, which could lead to the premature failure of the columns.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Provision: 9.17.3.4.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F22-OS2.4]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of adjustable steel columns will fall significantly below expectations.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of adjustable steel columns will fall significantly below expectations.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of adjustable steel columns will fall significantly below expectations.

For columns that support exterior walls or roofs, this is to limit the probability of excessive deformation or deflection, which could lead to compromised environmental separators, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- further compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of adjustable steel columns will fall significantly below expectations.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

[F20, F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of adjustable steel columns will fall significantly below expectations.

This is to limit the probability of:

- compromised structural integrity,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the compromised operation of doors or windows required for egress in an emergency, or
- for floors and elements supporting floors, persons losing their balance, tripping or falling.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

### **Provision: 9.17.3.4.(2)**

---

#### **Intent(s)**

*Intent 1.* To expand the application of Part 4 to include steel columns whose imposed loads are likely to exceed the resistance of the steel columns identified in Section 9.17.

### **Provision: 9.17.4.1.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing support across all laminates, which could lead to shear failure at the interface of laminates in built-up wood beams, which could lead to structural failure of beams, or
- insufficient contact area between the top of the columns and the beams they support, which could lead to crushing of wood fibres in beams.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20-OP2.1]

[F20, F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing support across all laminates, which could lead to shear failure at the interface of laminates in built-up wood beams, which could lead to structural failure of beams, or
- insufficient contact area between the top of the columns and the beams they support, which could lead to crushing of wood fibres in beams.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or

- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, and
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing support across all laminates, which could lead to shear failure at the interface of laminates in built-up wood beams, which could lead to structural failure of beams, or
- insufficient contact area between the top of the columns and the beams they support, which could lead to crushing of wood fibres in beams.

For columns that support exterior walls or roofs, this is to limit the probability of excessive deformation or deflection, or compromised air barrier systems, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- further compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing support across all laminates, which could lead to shear failure at the interface of laminates in built-up wood beams, which could lead to structural failure of beams, or

---

## **Intent Statements: NBC 2010**

- insufficient contact area between the top of the columns and the beams they support, which could lead to crushing of wood fibres in beams.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate bearing support across all laminates, which could lead to shear failure at the interface of laminates in built-up wood beams, which could lead to structural failure of beams, or
- insufficient contact area between the top of the columns and the beams they support, which could lead to crushing of wood fibres in beams.

OS2

### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of columns having inadequate strength, which could lead to an inability to resist loads transmitted through supported members.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or

- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20, F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of columns having inadequate strength, which could lead to an inability to resist loads transmitted through supported members.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure,
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to
  - the excessive deformation or deflection of walls, and
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of columns having inadequate strength, which could lead to an inability to resist loads transmitted through supported members.

For columns that support environmental separators, this is to limit the probability of excessive deformation or deflection, or compromised air barrier systems, which could lead to:

- condensation,
- precipitation ingress, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

---

## **Intent Statements: NBC 2010**

- further compromised integrity of environmental separators, which could lead to the deterioration of building elements.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of columns having inadequate strength, which could lead to an inability to resist loads transmitted through supported members.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of columns having inadequate strength, which could lead to an inability to resist loads transmitted through supported members.

This is to limit the probability of:

- compromised structural integrity, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this to limit the probability of excessive deflection or vibration of floors, which could lead to a loss of balance, tripping or falling, which could lead to harm to persons.

---

## **Provision: 9.17.4.2.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate strength of individual members,
- discontinuity of individual members, or
- compromised load transfer among members.

This is to limit the probability:

- that the column members will be unable to resist expected vertical loads, which could lead to buckling of individual members,
- of compromised resistance to buckling, or
- of unequal load sharing among members of built-up wood columns, which could lead to progressive structural failures of column members.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, excessive deformation or deflection of exterior walls or roofs, which could lead to the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Intent(s)**

*Intent 1.* To define the term “heated crawl spaces” as it is used in Section 9.18.

**Provision: 9.18.1.3.(2)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.33., which contains requirements regarding heating systems for crawl spaces.

**Provision: 9.18.1.3.(3)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.25., which contains requirements regarding insulation, air barrier systems and vapour barriers.

**Provision: 9.18.2.1.(1)**

---

**Objective**

OH1

**Attributions**

[F82-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of an inability to inspect conditions or services in crawl spaces, which could lead to:

- malfunctioning or inoperable building services, or
- the ingress of water from the ground going undetected.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity or the accumulation of moisture,
- inadequate ventilation,
- the production of hazardous by-products of combustion,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.18.2.1.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F63-OS2.3] Applies where crawl spaces are unheated and access is from the interior.

[F42, F61-OS2.3] Applies where crawl spaces are heated or unheated and access is from the exterior.

#### **Intent(s)**

*Intent 1.* To limit the probability of unprotected access openings, which could lead to:

- where crawl spaces are unheated and access is from the interior, moisture transfer from the interior, or
- where crawl spaces are heated or unheated and access is from the exterior:
  - the ingress of precipitation,
  - an infestation of insects or vermin, or
  - compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces, relative humidity or drafts,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F63-OS2.3] Applies where crawl spaces are unheated and access is from the interior.

[F42, F61-OS2.3] Applies where crawl spaces are heated or unheated and access is from the exterior.

#### **Intent(s)**

*Intent 1.* To limit the probability of unprotected access openings, which could lead to:

- where crawl spaces are unheated and access is from the interior, moisture transfer from the interior, or
- where crawl spaces are heated or unheated and access is from the exterior:
  - the ingress of precipitation, or
  - an infestation of insects or vermin.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- for environmental separators or elements supporting an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

**Objective**

OH2

**Attributions**

[F42-OH2.4, OH2.5] Applies where crawl spaces are heated or unheated and access is from the exterior.

**Intent(s)**

*Intent 1.* To limit the probability of unprotected access openings, which could lead to the ingress of insects or vermin, which could lead to unsanitary conditions, which could lead to harm to persons.

---

**Provision: 9.18.3.1.(1)**

---

**Objective**

OH1

**Attributions**

[F62-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of high relative humidity in crawl spaces, which could lead to condensation or the accumulation of moisture.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F62-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of high relative humidity in crawl spaces, which could lead to condensation or the accumulation of moisture, which could lead to deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

**Provision: 9.18.3.1.(2)**

---

**Objective**

OH1

**Attributions**

[F62-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate ventilation capacity in crawl spaces, which could lead to inadequate ventilation, which could lead to high relative humidity and the accumulation of moisture.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F62-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate ventilation capacity in crawl spaces, which could lead to inadequate ventilation, which could lead to high relative humidity and the accumulation of moisture.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

## **Provision: 9.18.3.1.(3)**

---

### **Objective**

OH1

### **Attributions**

9.18.3.1.(3)(a) [F62-OH1.1, OH1.2]

9.18.3.1.(3)(b) [F61, F42-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate ventilation, which could lead to high relative humidity and the accumulation of moisture,
- insect infestation, or
- the ingress of precipitation.

This is to limit the probability of:

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS2

### **Attributions**

9.18.3.1.(3)(a), 9.18.3.1.(3)(b) [F61, F62, F42-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

---

## **Intent Statements: NBC 2010**

- inadequate ventilation, which could lead to high relative humidity and the accumulation of moisture,
- insect infestation, or
- the ingress of precipitation.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

### **Objective**

OH2

### **Attributions**

9.18.3.1.(3)(b) [F42-OH2.3, OH2.5]

### **Intent(s)**

*Intent 1.* To limit the probability of inappropriately designed vents, which could lead to the ingress of insects or vermin, which could lead to unsanitary conditions, which could lead to harm to persons.

---

### **Provision: 9.18.3.2.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Section 9.32., which contains requirements regarding the ventilation of heated crawl spaces.

---

### **Provision: 9.18.4.1.(1)**

---

### **Objective**

OH1

### **Attributions**

[F82-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to repair malfunctioning or inoperable building services.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- inadequate ventilation,
- the production of hazardous combustion products,
- continuously leaking water supply pipes, which could lead to the accumulation of moisture, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- continuously leaking sewer pipes.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH2

### **Attributions**

[F82-OH2.1]

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to repair malfunctioning or inoperable sanitary services, which could lead to the inadequate disposal of human or domestic waste, which could lead to unsanitary conditions, which could lead to harm to persons.

---

## **Provision: 9.18.5.1.(1)**

---

### **Objective**

OH1

### **Attributions**

[F60-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- the ingress of rainwater,
- the ingress of surface water, or
- for heated crawl spaces, the ingress of water, which could lead to compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F60-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- the ingress of rainwater, or
- the ingress of surface water.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

**Provision: 9.18.5.1.(2)**

**Intent(s)**

*Intent 1.* To direct Code users to Subsections 9.14.2. to 9.14.4. which contain requirements regarding the drainage of foundation walls.

---

**Provision: 9.18.5.1.(3)**

**Intent(s)**

*Intent 1.* To expand the application of Subsection 9.16.3. to include the drainage of ground cover in crawl spaces.

*Intent 2.* To direct Code users to Subsection 9.16.3., which contains requirements regarding the drainage of floors-on-ground.

---

**Provision: 9.18.5.1.(4)**

**Intent(s)**

*Intent 1.* To direct Code users to Section 9.14., which contains requirements regarding drains.

---

**Provision: 9.18.6.1.(1)**

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of:

- the ingress of moisture that is not under hydrostatic pressure from the ground, or
- the ingress of moisture that is not under hydrostatic pressure from the ground, which could lead to compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of the ingress of moisture that is not under hydrostatic pressure from the ground, which could lead to deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

### **Provision: 9.18.6.1.(2)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2]

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity in the ground cover, which could lead to:

- the ingress of moisture that is not under hydrostatic pressure from the ground, or
- the ingress of moisture that is not under hydrostatic pressure from the ground, which could lead to compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity in the ground cover, which could lead to the ingress of moisture that is not under hydrostatic pressure from the ground.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

**Provision: 9.18.6.2.(1)**

---

**Objective**

OH1

**Attributions**

[F40, F61-OH1.1] [F61-OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability:

- of an inadequate resistance to air and moisture transfer, or
- that the performance of polyethylene sheets will fall significantly below expectations.

This is to limit the probability of:

- the ingress of moisture that is not under hydrostatic pressure from the ground, or
- the infiltration of soil gas.

This is to limit the probability of:

- an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability:

- of an inadequate resistance to air and moisture transfer, or
- that the performance of polyethylene sheets will fall significantly below expectations.

This is to limit the probability of the ingress of moisture that is not under hydrostatic pressure from the ground, which could lead to deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.25.3.

---

*Intent 1.* To limit the probability of discontinuity in the ground cover, which could lead to the ingress of moisture that is not under hydrostatic pressure from the ground, which could lead to deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

### **Provision: 9.18.6.2.(3)**

---

#### **Objective**

OH1

#### **Attributions**

[F40-OH1.1]

#### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity between the ground cover and the soil gas control component in foundation walls, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Provision: 9.18.6.2.(4)**

---

**Objective**

OH1

**Attributions**

[F40, F61-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity of the air barrier system at penetrations through the ground cover, which could lead to the ingress of moisture that is not under hydrostatic pressure from the ground.

This is to limit the probability of:

- an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of environmental separators or of elements protected by the separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of discontinuity of the air barrier system at penetrations through the ground cover, which could lead to the infiltration of soil gas, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity of the air barrier system at penetrations through the ground cover, which could lead to the ingress of moisture that is not under hydrostatic pressure from the ground, which could lead to deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

**Provision: 9.18.7.1.(1)**

---

**Objective**

OH1

**Attributions**

[F51-OH1.1, OH1.2]

**Intent(s)**

*Intent 1.* To limit the probability that crawl spaces will not perform adequately as warm-air plenums, which could lead to the inadequate heating of the upper storeys of buildings, which could lead to:

- an inadequate control of the temperature of interior spaces, or

---

## **Intent Statements: NBC 2010**

- condensation, which could lead to the generation of pollutants from biological growth or from materials that become unstable on wetting.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces, and
- the inadequate thermal comfort of persons.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F51-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that crawl spaces will not perform adequately as warm-air plenums, which could lead to the inadequate heating of the upper storeys of buildings, which could lead to condensation, which could lead to deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

### **Provision: 9.18.7.1.(2)**

---

### **Objective**

OS1

### **Attributions**

[F02-OS1.2]

### **Intent(s)**

*Intent 1.* To limit the probability that material having a high flame-spread rating will be used in crawl spaces that are directly connected to living space above (registers having no ducts), which could lead to the spread of fire or smoke to other parts of the building within the time required for evacuation, which could lead to harm to persons.

---

### **Provision: 9.18.7.1.(3)**

---

### **Objective**

OS1

### **Attributions**

[F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that debris, such as smouldering cigarette butts, will fall through floor registers and lead to the ignition of combustible materials in the crawl space plenum, which could lead to harm to persons.

---

### **Provision: 9.18.7.1.(4)**

---

### **Objective**

OS1

### **Attributions**

9.18.7.1.(4)(a), 9.18.7.1.(4)(b) [F01-OS1.1]

**Intent(s)**

*Intent 1.* To limit the probability that debris, such as smouldering cigarette butts, will fall through the floor register outside the protected area and lead to the ignition of combustible materials in the crawl space plenum, which could lead to harm to persons.

**Provision: 9.19.1.1.(1)**

---

**Objective**

OH1

**Attributions**

[F51, F62-OH1.1, OH1.2]

[F51-OH1.3] Applies to sloped roof assemblies that may be subject to ice damming.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate venting, which could lead to:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams.

This is to limit the probability of:

- the ingress of water, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F62, F51-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate venting, which could lead to:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

### **Provision: 9.19.1.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F51, F62-OH1.1, OH1.2]

[F51-OH1.3] Applies to sloped roof assemblies that may be subject to ice damming.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate vent area for roofs, which could lead to:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams.

This is to limit the probability of:

- the ingress of water, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F62, F51-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate vent area for roofs, which could lead to:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

## **Intent Statements: NBC 2010**

### **Provision: 9.19.1.2.(5)**

---

#### **Objective**

OS2

#### **Attributions**

[F42, F51, F61, F62-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of vents will fall significantly below expectations with respect to:

- material integrity and durability, including corrosion resistance, which could lead to the premature failure of vents,
- flashing provided by flanges,
- wind and rain resistance,
- protection against the ingress of insects or vermin, and
- net ventilating area.

This is to limit the probability of:

- precipitation ingress,
- an infestation of insects or vermin, and
- insufficient venting, which could lead to:
  - condensation, or
  - the formation of ice dams, which could lead to the ingress of water.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

---

#### **Objective**

OH1

#### **Attributions**

[F42-OH1.1] Applies to resistance to the entry of insects.

[F51, F61, F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability that the performance of vents will fall significantly below expectations with respect to:

- material integrity and durability, including corrosion resistance, which could lead to the premature failure of vents,

---

**Objective**

OH2

**Attributions**

[F42-OH2.5] Applies to resistance to the entry of insects.

**Intent(s)**

*Intent 1.* To limit the probability that the performance of vents will fall significantly below expectations with respect to protection against the ingress of insects, which could lead to an infestation of insects, which could lead to unsanitary conditions, which could lead to harm to persons.

---

**Provision: 9.19.1.3.(1)**

---

**Objective**

OH1

**Attributions**

[F62, F51-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate airflow through the vented space, which could lead to:

- condensation in the space, or
- the formation of ice dams, which could lead to the ingress of water.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation in interior spaces or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and

---

## **Intent Statements: NBC 2010**

- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F62, F51-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate airflow through the vented space, which could lead to:

- condensation in the space, or
- the formation of ice dams, which could lead to the ingress of water.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

---

## **Provision: 9.19.1.3.(2)**

---

### **Objective**

OH1

### **Attributions**

[F62, F51-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate airflow through the vented space, which could lead to:

- condensation in the space, or
- the formation of ice dams, which could lead to the ingress of water.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces,
- water accumulation in interior spaces or an inadequate control of relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt junctions of sloped roofs and exterior walls where preformed baffles are installed from the minimum clear air space dimensions specified in Sentence 9.19.1.3.(1), based on the demonstrated effectiveness of a reduced unobstructed space provided by insulation baffles.

---

**Objective**

OS2

**Attributions**

[F62, F51-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate airflow through the vented space, which could lead to:

- condensation in the space, or
- the formation of ice dams, which could lead to the ingress of water.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

*Intent 2.* To exempt junctions of sloped roofs and exterior walls where preformed baffles are installed from the minimum clear air space dimensions specified in Sentence 9.19.1.3.(1), based on the demonstrated effectiveness of a reduced unobstructed space provided by insulation baffles.

**Provision: 9.19.1.3.(3)**

---

**Objective**

OH1

**Attributions**

[F51, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- restricted air flow through the vented space, or
- excessive air flow through the insulation, which could lead to reduced thermal resistance.

This is to limit the probability of:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams on sloped roofs.

This is to limit the probability of:

- the ingress of water, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

### **Objective**

OS2

### **Attributions**

[F51, F62-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- restricted air flow through the vented space, or
- excessive air flow through the insulation, which could lead to reduced thermal resistance.

This is to limit the probability of:

- condensation,
- the accumulation of moisture, or
- the formation of ice dams on sloped roofs.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of attic or roof assemblies or of elements protected by attic or roof assemblies, which could lead to harm to persons.

---

### **Provision: 9.19.1.4.(1)**

### **Intent(s)**

*Intent 1.* To exempt from the application of Articles 9.19.1.1. to 9.19.1.3., roof configurations where:

- heat and moisture transfer into or out of the space (caused by air pressure differences across the building envelope induced by stack effect) is reduced because the lower portion of the roof is close to the neutral pressure plane, and
- the likelihood of snow accumulation and ice damming is limited.

---

### **Provision: 9.19.1.4.(2)**

### **Intent(s)**

*Intent 1.* To clarify that Articles 9.19.1.1. to 9.19.1.3. also apply to the upper portion of mansard or gambrel style roofs.

---

### **Provision: 9.19.2.1.(1)**

### **Objective**

OS2

### **Attributions**

[F82-OS2.3]

### **Application**

*Application 1.* In *buildings* to which Part 9 applies [see Sentence 1.3.3.3.(1) for application of Part 9], access to *attic or roof spaces* that measure:

- not less than 3 m<sup>2</sup> in area,
- not less than 1 m in length or width, and

- not less than 600 mm in height over an area not less than 3 m<sup>2</sup> and not less than 1 m in length or width.

**Intent(s)**

*Intent 1.* To limit the probability that attic or roof spaces will be inaccessible for periodic inspection or maintenance, which could lead to:

- deficiencies in building components going undetected, which could lead to:
  - condensation and the accumulation of moisture, or
  - the formation of ice dams, or
- the need to demolish building components in order to gain access.

This is to limit the probability of damage to or deterioration of building components, which could lead to structural failure, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F82-OH1.1, OH1.2, OH1.3]

**Application**

*Application 1.* In *buildings* to which Part 9 applies [see Sentence 1.3.3.3.(1) for application of Part 9], access to *attic or roof spaces* that measure:

- not less than 3 m<sup>2</sup> in area,
- not less than 1 m in length or width, and
- not less than 600 mm in height over an area not less than 3 m<sup>2</sup> and not less than 1 m in length or width.

**Intent(s)**

*Intent 1.* To limit the probability that attic or roof spaces will be inaccessible for periodic inspection or maintenance, which could lead to:

- deficiencies in building components going undetected, or
- the need to demolish building components in order to gain access.

This is to limit the probability of condensation going undetected or the ingress of water.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.19.2.1.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F82-OH1.1, OH1.2]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- the deterioration of building components going undetected, which could lead to
  - condensation and the accumulation of moisture, or
  - the formation of ice dams, or
- the need to demolish building components in order to gain access.

This is to limit the probability of:

- the ingress of water, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators.

This is to limit the probability of:

#### **Objective**

OS2

#### **Attributions**

[F82-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- the deterioration of building components going undetected, which could lead to:
  - condensation and the accumulation of moisture, or
  - the formation of ice dams, or
- the need to demolish building components in order to gain access.

This is to limit the probability of structural damage, which could lead to harm to persons.

**Provision: 9.19.2.1.(3)**

---

**Objective**

OH1

**Attributions**

[F42-OH1.1] [F61-OH1.1, OH1.2, OH1.3] Applies where access is from the exterior.

[F42-OH1.1] Applies where access is from an unheated enclosed space.

[F51-OH1.2] Applies where access is from an interior heated space.

**Intent(s)**

*Intent 1.* To limit the probability of openings in environmental separators, which could lead to:

- the ingress of precipitation,
- the ingress of insects or vermin,
- excessive heat transfer,
- condensation,
- the accumulation of moisture or the ingress of water backed up by ice dams,
- drafts, or
- the ingress of pollutants from adjacent attic or roof spaces.

This is to limit the probability of:

- compromised thermal performance of components intended to provide resistance to heat transfer, which could lead to an inadequate control of the temperature of interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to compromised integrity of ceilings acting as environmental separators, or
- water accumulation in interior spaces.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61, F42-OS2.3] Applies where access is from the exterior or an unheated enclosed space.

**Intent(s)**

*Intent 1.* To limit the probability of openings in environmental separators, which could lead to:

- the ingress of precipitation,
- the ingress of insects or vermin,
- excessive heat transfer,
- compromised thermal performance of components intended to provide resistance to heat transfer,
- condensation,

---

## **Intent Statements: NBC 2010**

- the accumulation of moisture or the ingress of water backed up by ice dams,
- drafts, or
- the ingress of pollutants from adjacent attic or roof spaces.

This is to limit the probability of deterioration, which could lead to compromised structural integrity of building components, which could lead to harm to persons.

---

### **Objective**

OH2

### **Attributions**

[F42-OH2.5] Applies where access is from the exterior or an unheated enclosed space.

### **Intent(s)**

*Intent 1.* Where access is from the exterior or unheated enclosed space (e.g. a garage), to limit the probability of openings in environmental separators, which could lead to the ingress of insects or vermin, which could lead to negative effects on sanitation, which could lead to harm to persons.

---

### **Provision: 9.20.1.1.(1)**

---

### **Intent(s)**

*Intent 1.* To state the application of Section 9.20.

---

### **Provision: 9.20.1.1.(2)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 4.3.2. to include above-ground masonry construction and insulating concrete form walls not in contact with the ground that are not addressed in Section 9.20.

---

### **Provision: 9.20.1.2.(1)**

---

### **Intent(s)**

*Intent 1.* To state, in part, the application of Subsection 9.20.15.

---

### **Provision: 9.20.1.2.(2)**

---

### **Intent(s)**

*Intent 1.* To state, in part, the application of Subsection 9.20.15.

---

### **Provision: 9.20.2.1.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20, F80-OS2.1]

[F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

**Intent 1.** To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F80-OP2.1, OP2.4]

[F20, F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

**Intent 1.** To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, and
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

**Intent(s)**

**Intent 1.** To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F80-OS3.1] Applies to floors and elements that support floors.

[F20, F80-OS3.4] Applies to masonry used in *chimneys* and fireplaces.

### **Intent(s)**

*Intent 1.* To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

This is to limit the probability of:

- for floors and elements supporting floors, excessive deflection, which could lead to persons losing their balance, tripping or falling, or

- where masonry is used in chimneys and fireplaces, the cracking of masonry units, which could lead to the leakage of combustion products, which could lead to asphyxiation or acute poisoning.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F80-OS1.2] Applies to assemblies required to provide fire resistance.

[F01-OS1.1, OS1.2] Applies to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

This is to limit the probability of:

- where masonry construction is required to provide fire resistance, excessive deformation or cracking, which could lead to compromised fire resistance of the assembly, or
- for chimneys and fireplaces, excessive heat transfer, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F80-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OP1

**Attributions**

[F20, F80-OP1.2] Applies to assemblies required to provide fire resistance.

[F01, F20, F80-OP1.2] Applies to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability that performance, with respect to loadbearing capacity, water transfer and freeze-thaw resistance, will fall significantly below expectations, which could lead to an inability to resist expected gravity or lateral loads, as well as moisture or temperature loads.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- where masonry construction is required to provide fire resistance, excessive deformation or cracking, which could lead to compromised fire resistance of the assembly, or
- for chimneys and fireplaces, excessive heat transfer, which could lead to the ignition of combustible building components.

This is to limit the probability of damage to the building.

---

### **Provision: 9.20.2.2.(1)**

#### **Objective**

OS2

#### **Attributions**

[F20, F80-OS2.1]

[F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate brick-to-brick bond strength.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

*Intent 2.* To direct Code users to Article 9.20.2.1.

---

#### **Objective**

OP2

#### **Attributions**

[F20, F80-OP2.1, OP2.4]

*Intent 1.* To limit the probability of an inability to resist gravity, lateral or impact loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

*Intent 2.* Where masonry is used in fireplaces or chimneys, to limit the probability of an inability to withstand high temperatures, which could lead to cracking, which could lead to structural failure, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity, lateral or impact loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

---

## **Intent Statements: NBC 2010**

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

**Intent 2.** Where masonry is used in fireplaces or chimneys, to limit the probability of an inability to withstand high temperatures, which could lead to cracking, which could lead to structural failure, which could lead to damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

### **Intent(s)**

**Intent 1.** To limit the probability of an inability to resist gravity, lateral or impact loads and high temperatures.

This is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,

- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity, lateral or impact loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

[F01, F20-OS3.4] Applies to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity, lateral or impact loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

This is to limit the probability of:

- for floors and elements supporting floors, excessive deflection, which could lead to persons losing their balance, tripping or falling, or
- where masonry is used in chimneys and fireplaces, the cracking of masonry units, which could lead to the leakage of combustion products, which could lead to asphyxiation or acute poisoning.

This is to limit the probability of harm to persons.

*Intent 2.* To limit the probability of an inability to withstand high temperatures, which could lead to the cracking of masonry units, which could lead to the leakage of combustion products, which could lead to asphyxiation or acute poisoning, which could lead to harm to persons.

---

**Objective**

OS1

**Attributions**

[F01, F20-OS1.1] [F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of an inability to resist gravity, lateral or impact loads and high temperatures.

Where assemblies are required to provide fire resistance, this is to limit the probability of:

- compromised fire resistance of the assembly, or
- excessive heat transfer, which could lead to the ignition of combustible building components.

This is to limit the probability of harm to persons.

---

### **Objective**

OP1

### **Attributions**

[F01, F20-OP1.1] [F20-OP1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inability to resist gravity, lateral or impact loads and high temperatures.

Where assemblies are required to provide fire resistance, this is to limit the probability of:

- compromised fire resistance of the assembly, or
- excessive heat transfer, which could lead to the ignition of combustible building components.

This is to limit the probability of damage to the building.

---

## **Provision: 9.20.2.4.(1)**

---

### **Objective**

OS2

### **Attributions**

[F80-OS2.1]

[F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to sulfate attack or stresses resulting from water absorption and freeze-thaw cycling.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, and
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F80-OP2.1, OP2.4]

[F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to sulfate attack or stresses resulting from water absorption and freeze-thaw cycling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to sulfate attack or stresses resulting from water absorption and freeze-thaw cycling.

This is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or

---

## **Intent Statements: NBC 2010**

- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to sulfate attack or stresses resulting from water absorption and freeze-thaw cycling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

## Intent Statements: NBC 2010

---

### Objective

OS3

### Attributions

[F80-OS3.1] Applies to elements that support floors.

[F80-OS3.4] Applies to masonry used in *chimneys* and fireplaces.

### Intent(s)

*Intent 1.* To limit the probability that such concrete blocks will be of inadequate mass or absorb excessive amounts of water, which could lead to inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry or elements supported by masonry, or
- where elements support or are part of an environmental separator, the failure of required environmental separation elements, which could lead to deterioration, which could lead to compromised structural integrity.

This is to limit the probability of

- excessive deflection of supported floors, which could lead to persons losing their balance, tripping or falling, or
- the failure of fireplaces or chimneys, which could lead to the leakage of combustion products, including carbon monoxide gas, into living space, which could lead to the asphyxiation or acute poisoning of persons.

This is to limit the probability of harm to persons.

---

### Objective

OP1

### Attributions

[F80-OP1.2] Applies to concrete blocks in *chimneys* and fireplaces.

### Intent(s)

*Intent 1.* To limit the probability that such concrete blocks will be of inadequate mass or absorb excessive amounts of water, which could lead to inadequate resistance to freeze-thaw stresses.

For chimneys and fireplaces, this is to limit the probability of excessive heat transfer, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

## Provision: 9.20.2.7.(1)

---

### Objective

OS2

### Attributions

[F20, F80-OS2.1]

[F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### Intent(s)

*Intent 1.* To limit the probability that concrete blocks will be unable to resist expected structural or environmental loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,

- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F80-OP2.1, OP2.4]

[F20, F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability that concrete blocks will be unable to resist expected structural or environmental loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability that concrete blocks will be unable to resist expected structural or environmental loads.

This is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

OS1

### **Attributions**

[F20, F80-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of cement and aggregate under expected structural and environmental loads will fall significantly below expectations, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

Where assemblies are required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Provision: 9.20.3.1.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or bond strength, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or bond strength, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or bond strength, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or bond strength, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or bond strength, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or bond strength, which could lead to cracking at mortar joints and inadequate bonding to masonry units.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

**Provision: 9.20.3.1.(3)**

---

**Objective**

OS2

**Attributions**

[F21-OS2.1]

[F21-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of oxides in the lime being hydrated after mortar placement, which could lead to the expansion and cracking of the mortar.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F21-OP2.1, OP2.4]

[F21-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

**Intent 1.** To limit the probability of oxides in the lime being hydrated after mortar placement, which could lead to the expansion and cracking of mortar.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

### **Intent(s)**

**Intent 1.** To limit the probability of oxides in the lime being hydrated after mortar placement, which could lead to the expansion and cracking of mortar.

This is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F21-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of oxides in the lime being hydrated after mortar placement, which could lead to the expansion and cracking of mortar.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F21-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of oxides in the lime being hydrated after mortar placement, which could lead to the expansion and cracking of mortar.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F21-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of oxides in the lime being hydrated after mortar placement, which could lead to the expansion and cracking of mortar.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

---

## **Intent Statements: NBC 2010**

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

### **Provision: 9.20.3.1.(4)**

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F21-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an excessively high cement/aggregate ratio, which could lead to poor workability, excessive compressive strength and attendant high shrinkage, which could lead to tensile stresses and the cracking of mortar or masonry units, or
- an excessively low cement/aggregate ratio, which could lead to weak, porous mortar and inadequate bonding with masonry units.

Where masonry construction is required to provide fire resistance, this is to limit the probability of excessive deformation or cracking, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Provision: 9.20.3.2.(4)**

---

### **Objective**

OS2

### **Attributions**

[F20, F21-OS2.1]

[F20, F21-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an excessively high cement/aggregate ratio, which could lead to poor workability, excessive compressive strength and attendant high shrinkage, which could lead to cracking of grout, or
- an excessively low cement/aggregate ratio, which could lead to weak, porous grout and inadequate bonding with masonry units and reinforcing steel.

This is to limit the probability of compromised structural integrity, which could lead to:

- the structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F21-OP2.1, OP2.4]

[F20, F21-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- an excessively high cement/aggregate ratio, which could lead to poor workability, excessive compressive strength and attendant high shrinkage, which could lead to cracking of grout, or
- an excessively low cement/aggregate ratio, which could lead to weak, porous grout and inadequate bonding with masonry units and reinforcing steel.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability of:

- an excessively high cement/aggregate ratio, which could lead to poor workability, excessive compressive strength and attendant high shrinkage, which could lead to cracking of grout, or
- an excessively low cement/aggregate ratio, which could lead to weak, porous grout and inadequate bonding with masonry units and reinforcing steel.

This is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

- condensation,

---

## **Intent Statements: NBC 2010**

- precipitation ingress,
- moisture ingress,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F21-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an excessively high cement/aggregate ratio, which could lead to poor workability, excessive compressive strength and attendant high shrinkage, which could lead to cracking of grout, or
- an excessively low cement/aggregate ratio, which could lead to weak, porous grout and inadequate bonding with masonry units and reinforcing steel.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F21-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- an excessively high cement/aggregate ratio, which could lead to poor workability, excessive compressive strength and attendant high shrinkage, which could lead to cracking of grout, or

- an excessively low cement/aggregate ratio, which could lead to weak, porous grout and inadequate bonding with masonry units and reinforcing steel.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

**Provision: 9.20.4.1.(2)**

**Objective**

OH1

**Attributions**

[F20, F61-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive deviation from the optimum mortar-joint thickness required to ensure continuous support of masonry units while maintaining adequate mortar-to-masonry-unit bond strength and adequate compressive strength of assemblies.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Objective**

OS2

**Attributions**

[F20, F61-OS2.1]

[F20, F61-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of excessive deviation from the optimum mortar-joint thickness required to ensure continuous support of masonry units while maintaining adequate mortar-to-masonry-unit bond strength and adequate compressive strength of assemblies.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,

---

## **Intent Statements: NBC 2010**

- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20, F61-OP2.1, OP2.4]

[F20, F61-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive deviation from the optimum mortar-joint thickness required to ensure continuous support of masonry units while maintaining adequate mortar-to-masonry-unit bond strength and adequate compressive strength of assemblies.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F61-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive deviation from the optimum mortar-joint thickness required to ensure continuous support of masonry units while maintaining adequate mortar-to-masonry-unit bond strength and adequate compressive strength of assemblies.

This is to limit the probability of precipitation or meltwater ingress, which could lead to deterioration due to freeze-thaw stresses.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F61-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive deviation from the optimum mortar-joint thickness required to ensure continuous support of masonry units while maintaining adequate mortar-to-masonry-unit bond strength and adequate compressive strength of assemblies.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F61-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive deviation from the optimum mortar-joint thickness required to ensure continuous support of masonry units while maintaining adequate mortar-to-masonry-unit bond strength and adequate compressive strength of assemblies.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.20.4.2.(1)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator and to masonry used in *chimneys* and fireplaces.

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity in head and bed mortar joints, which could lead to inadequate tensile and compressive strength of mortar joints.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to:
  - where masonry units support or are part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, or
  - where masonry is used in chimneys and fireplaces, compromised integrity of chimneys or fireplaces.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting,
- deterioration, which could lead to further compromised integrity of environmental separators, or
- where masonry is used in chimneys and fireplaces, the leakage of combustion products.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of discontinuity in head and bed mortar joints, which could lead to inadequate tensile and compressive strength of mortar joints.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of discontinuity in head and bed mortar joints, which could lead to inadequate tensile and compressive strength of mortar joints.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:

## **Provision: 9.20.5.1.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20, F21-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive deflection, shrinkage or uneven settlement of elements or constructions that support masonry.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,

- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F21-OS2.1]

[F20, F21-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of excessive deflection, shrinkage or uneven settlement of elements or constructions that support masonry.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F21-OP2.1, OP2.4]

[F20, F21-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of excessive deflection, shrinkage or uneven settlement of elements or constructions that support masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

---

## **Intent Statements: NBC 2010**

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F21-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive deflection, shrinkage or uneven settlement of elements or constructions that support masonry.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F21-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive deflection, shrinkage or uneven settlement of elements or constructions that support masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

[F20, F21-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive deflection, shrinkage or uneven settlement of elements or constructions that support masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.20.5.1.(2)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of eccentric loading.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of eccentric loading.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of eccentric loading.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of eccentric loading.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of eccentric loading.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of eccentric loading.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.20.5.2.(1)**

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

- the accumulation of corrosion by-products between lintels and masonry, which could lead to compressive stresses.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- excessively rapid corrosion, which could lead to the excessive deflection or structural failure of lintels, or
- the accumulation of corrosion by-products between lintels and masonry, which could lead to compressive stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F80-OS3.1] Applies to floors and elements that support floors.

[F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- excessively rapid corrosion, which could lead to the excessive deflection or structural failure of lintels, or
- the accumulation of corrosion by-products between lintels and masonry, which could lead to compressive stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, or
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.20.6.1.(1)**

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that masonry exterior walls will be unable to resist expected structural loads.

Where masonry units support or are part of an environmental separator, this is to limit the probability of deformation or cracking, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

### **Intent(s)**

*Intent 1.* To limit the probability that masonry exterior walls will be unable to resist expected structural loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that masonry exterior walls will be unable to resist expected structural loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that masonry exterior walls will be unable to resist expected structural loads.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that masonry exterior walls will be unable to resist expected structural loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that masonry exterior walls will be unable to resist expected structural loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or

---

## **Intent Statements: NBC 2010**

- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors. For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

### **Provision: 9.20.6.2.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- inadequate width of masonry units in loadbearing contact with each other, which could lead to an inability to resist expected gravity or lateral loads,
- insufficient bond strength to resist tensile stresses in non-loadbearing masonry cavity walls, or
- inadequate bonding of ties with mortar, which could lead to inadequate pullout and pushout resistance.

Where masonry units support or are part of an environmental separator, this is to limit the probability of deformation or cracking, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient contact area between mortar and masonry veneer, which could lead to:

- the wall being unable to support its own weight or lateral loads,
- insufficient bonding area between ties and mortar, or
- insufficient bond strength between masonry units.

This is to limit the probability of:

- the structural failure of masonry veneer, or
- where masonry is exposed to precipitation, the cracking of masonry or mortar, which could lead to excessive water ingress, which could lead to the deterioration of building elements, which could lead to compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.3, OP2.5]

**Intent(s)**

*Intent 1.* To limit the probability of insufficient contact area between mortar and masonry veneer, which could lead to:

- the wall being unable to support its own weight or lateral loads,
- insufficient bonding area between ties and mortar, or
- insufficient bond strength between masonry units.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient contact area between mortar and masonry veneer, which could lead to:

- the wall being unable to support its own weight or lateral loads,
- insufficient bonding area between ties and mortar, or
- insufficient bond strength between masonry units.

Where masonry units support or are part of an environmental separator, this is to limit the probability of excessive moisture transfer through masonry units, which could lead to:

- precipitation ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of insufficient contact area between mortar and masonry veneer, which could lead to:

- the wall being unable to support its own weight or lateral loads,
- insufficient bonding area between ties and mortar, or
- insufficient bond strength between masonry units.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Provision: 9.20.6.4.(4)**

---

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 4.3.2. to include Part 9 buildings and to limit the application of Section 9.20.

---

**Provision: 9.20.6.5.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3, OS2.5] [F22-OS2.5]

**Intent(s)**

*Intent 1.* To limit the probability of an excessively high height-to-thickness ratio, which could lead to an inadequate resistance to expected wind loads.

This is to limit the probability of:

- cracking or toppling of parapets, or
- cracking of masonry or mortar, which could lead to excessive water ingress into the parapet, which could lead to the deterioration of elements in or below the parapet, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.3, OP2.5] [F22-OP2.5]

**Intent(s)**

*Intent 1.* To limit the probability of an excessively high height-to-thickness ratio, which could lead to an inadequate resistance to expected wind loads.

This is to limit the probability of:

- compromised structural integrity of parapets, or
- cracking of masonry or mortar, which could lead to excessive water ingress into the parapet, which could lead to the deterioration of elements in or below the parapet, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of an excessively high height-to-thickness ratio, which could lead to an inadequate resistance to expected wind loads.

This is to limit the probability of cracking of masonry or mortar, which could lead to excessive moisture transfer, which could lead to:

- precipitation ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Provision: 9.20.6.5.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F61-OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of rain, or melting snow or ice, entering the cavities between wythes of masonry.

This is to limit the probability of the deterioration of elements in or below the parapet, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F61-OP2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of rain, or melting snow or ice, entering the cavities between wythes of masonry.

This is to limit the probability of the deterioration of elements in or below the parapet, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of rain, or melting snow or ice, entering the cavities between wythes of masonry.

This is to limit the probability of:

- precipitation ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F61-OS1.2]

**Intent(s)**

*Intent 1.* To limit the probability of rain, or melting snow or ice, entering the cavities between wythes of masonry.

Where masonry construction is required to provide fire resistance, this is to limit the probability of precipitation or meltwater ingress, which could lead to deterioration due to freeze-thaw stresses, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.20.6.6.(1)****Intent(s)**

*Intent 1.* To expand the application of Subsection 4.3.2. to include slab facings and precast concrete panel facings on Part 9 buildings and to limit the application of Section 9.20.

---

**Provision: 9.20.7.1.(1)****Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that masonry adjacent to chases or recesses will be unable to accommodate vertical and horizontal loads, which could lead to cracking or structural failure.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that masonry adjacent to chases or recesses will be unable to accommodate vertical and horizontal loads, which could lead to cracking or structural failure.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that masonry adjacent to chases or recesses will be unable to accommodate vertical and horizontal loads, which could lead to cracking or structural failure.

Where masonry units support or are part of an environmental separator, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that masonry adjacent to chases or recesses will be unable to accommodate vertical and horizontal loads, which could lead to cracking or structural failure.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that masonry adjacent to chases or recesses will be unable to accommodate vertical and horizontal loads, which could lead to cracking or structural failure.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that masonry adjacent to chases or recesses will be unable to accommodate vertical and horizontal loads, which could lead to cracking or structural failure.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support of masonry above certain chases or recesses, which could lead to excessive deflection or cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support of masonry above certain chases or recesses, which could lead to excessive deflection or cracking.

This is to limit the probability of excessive deflection or vibration of floors, which could lead to persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.20.7.5.(1)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that face shells, which provide most of the loadbearing capacity of hollow units, will be removed, which could lead to an inability to accommodate vertical and horizontal loads, which could lead to cracking.

Where masonry units support or are part of an environmental separator, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,

---

## **Intent Statements: NBC 2010**

- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that face shells, which provide most of the loadbearing capacity of hollow units, will be removed, which could lead to an inability to accommodate vertical and horizontal loads, which could lead to cracking.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that face shells, which provide most of the loadbearing capacity of hollow units, will be removed, which could lead to an inability to accommodate vertical and horizontal loads, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or

- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that face shells, which provide most of the loadbearing capacity of hollow units, will be removed, which could lead to an inability to accommodate vertical and horizontal loads, which could lead to cracking.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that face shells, which provide most of the loadbearing capacity of hollow units, will be removed, which could lead to an inability to accommodate vertical and horizontal loads, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that face shells, which provide most of the loadbearing capacity of hollow units, will be removed, which could lead to an inability to accommodate vertical and horizontal loads, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

---

## **Intent Statements: NBC 2010**

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.20.8.1.(1)**

#### **Objective**

OH1

#### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads, which could lead to over-stressing of hollow masonry units, which could lead to cracking.

Where masonry units support or are part of an environmental separator, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads, which could lead to over-stressing of hollow masonry units, which could lead to cracking.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads, which could lead to over-stressing of hollow masonry units, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads, which could lead to over-stressing of hollow masonry units, which could lead to cracking.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads, which could lead to over-stressing of hollow masonry units, which could lead to cracking.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads, which could lead to over-stressing of hollow masonry units, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

## **Provision: 9.20.8.1.(2)**

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of localized over-stressing and crushing of wood plates under concentrated roof or floor loads transmitted through framing elements, which could lead to inadequate load distribution, which could lead to over-stressing of hollow masonry units, which could lead to cracking of such units.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt situations where another means of distributing roof and floor loads is provided from the application of Sentence 9.20.8.1.(1).

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of localized over-stressing and crushing of wood plates under concentrated roof or floor loads transmitted through framing elements, which could lead to inadequate load distribution, which could lead to over-stressing of hollow masonry units, which could lead to cracking of such units.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

*Intent 2.* To exempt situations where another means of distributing roof and floor loads is provided from the application of Sentence 9.20.8.1.(1).

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of localized over-stressing and crushing of wood plates under concentrated roof or floor loads transmitted through framing elements, which could lead to inadequate load distribution, which could lead to over-stressing of hollow masonry units, which could lead to cracking of such units.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

---

## **Intent Statements: NBC 2010**

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads between wythes, which could lead to over-stressing of cavity walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads between wythes, which could lead to over-stressing of cavity walls.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads between wythes, which could lead to over-stressing of cavity walls.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads between wythes, which could lead to over-stressing of cavity walls.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate distribution of roof or floor loads between wythes, which could lead to over-stressing of cavity walls.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

**Provision: 9.20.8.3.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- joists or beams being unable to resist expected gravity or lateral loads, which could lead to crushing of wood, or
- excessive stress on masonry units, which could lead to compression failure of masonry units.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of beams or masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- joists or beams being unable to resist expected gravity or lateral loads, which could lead to crushing of wood, or
- excessive stress on masonry units, which could lead to compression failure of masonry units.

This is to limit the probability of:

- compromised structural integrity of beams or masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of damage to the building.

**Provision: 9.20.8.3.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate bearing area, which could lead to:

- beams being unable to resist expected gravity or lateral loads, which could lead to crushing of wood, or
- excessive stress on masonry units, which could lead to compression failure of masonry units.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of beams or masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of structural collapse, which could lead to harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate bearing area, which could lead to:

- beams being unable to resist expected gravity or lateral loads, which could lead to crushing of wood, or
- excessive stress on masonry units, which could lead to compression failure of masonry units.

This is to limit the probability of:

- compromised structural integrity of beams or masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of damage to the building.

---

## **Provision: 9.20.8.3.(3)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate bearing area, which could lead to:

- joists being unable to resist expected gravity or lateral loads, which could lead to crushing of wood, or
- excessive stress on masonry units, which could lead to compression failure of masonry units.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of joists or masonry construction, or

- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of structural collapse, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate bearing area, which could lead to:

- joists being unable to resist expected gravity or lateral loads, which could lead to crushing of wood, or
- excessive stress on masonry units, which could lead to compression failure of masonry units.

This is to limit the probability of:

- compromised structural integrity of joists or masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of damage to the building.

---

**Provision: 9.20.8.4.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that masonry walls will be unable to resist the concentrated loads imposed by beams or columns, which could lead to cracking of masonry.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that masonry walls will be unable to resist the concentrated loads imposed by beams or columns, which could lead to cracking of masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that masonry walls will be unable to resist the concentrated loads imposed by beams or columns, which could lead to cracking of masonry.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability that masonry walls will be unable to resist the concentrated loads imposed by beams or columns, which could lead to cracking of masonry.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that masonry walls will be unable to resist the concentrated loads imposed by beams or columns, which could lead to cracking of masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability that masonry walls will be unable to resist the concentrated loads imposed by beams or columns, which could lead to cracking of masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or

---

## **Intent Statements: NBC 2010**

- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors. For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

### **Provision: 9.20.8.4.(2)**

---

#### **Objective**

OH1

#### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads and instability.

This is to limit the probability of:

- compromised structural integrity of masonry veneer, or
- cracking of masonry or mortar, which could lead to excessive water ingress into or through assemblies, which could lead to the deterioration of elements protected by the masonry, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads and instability.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.20.8.5.(2)**

---

**Objective**

OH1

**Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads and instability.

Where masonry units support or are part of an environmental separator, this is to limit the probability of cracking of masonry or mortar, which could lead to excessive moisture transfer.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1, OS2.5]

[F22-OS2.5]

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads and instability.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4, OP2.5]

[F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads and instability.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads and instability.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

**Provision: 9.20.8.5.(3)**

---

**Intent(s)**

*Intent 1.* To clarify the application of Sentence 9.20.8.5.(2) to rough stone masonry.

**Provision: 9.20.9.1.(1)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and

---

## **Intent Statements: NBC 2010**

- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.20.9.1.(2)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to in-plane and transverse shear stresses, which could lead to cracking or structural failure of vertical mortar joints.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

[F20, F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral support for wythes of masonry walls, which could lead to wythes and masonry walls being unable to resist transverse or vertical loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

This is to limit the probability of:

- for floors and elements supporting floors, persons losing their balance, tripping or falling, or
- the compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral support for wythes of masonry walls, which could lead to wythes and masonry walls being unable to resist transverse or vertical loads, which could lead to cracking or buckling.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Provision: 9.20.9.3.(1)**

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient number of bonding units, which could lead to inadequate load distribution among wythes, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or

- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or

### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient bonding area, which could lead to inadequate load distribution among wythes, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient bonding area, which could lead to inadequate load distribution among wythes, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient bonding area, which could lead to inadequate load distribution among wythes, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient bonding area, which could lead to inadequate load distribution among wythes, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

---

## **Intent Statements: NBC 2010**

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

### **Objective**

OS3

### **Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient bonding area, which could lead to inadequate load distribution among wythes, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

### **Provision: 9.20.9.4.(1)**

---

### **Intent(s)**

*Intent 1.* To state the application of Sentences 9.20.9.4.(3) to 9.20.9.4.(6).

### **Provision: 9.20.9.4.(2)**

---

### **Objective**

OH1

### **Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability that the performance of the ties will fall significantly below expectations, with respect to:

- corrosion resistance,
- resistance to buckling, tensile failure and withdrawal under compression and tensile loads, and
- transferring lateral loads from one wythe to another.

This is to limit the probability of inadequate load distribution among the wythes of multiple-wythe masonry walls, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,

- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate support for ties, which could lead to the excessive flexing of ties under lateral loads, which could lead to inadequate load distribution among the wythes of multiple-wythe masonry walls, which could lead to an inability to resist transverse or vertical loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.20.9.4.(6)**

---

#### **Objective**

OH1

#### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- concentrations of stress in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, and
- inadequate load distribution among the wythes of multiple-wythe masonry walls.

This is to limit the probability of cracking or buckling.

Where masonry units support or are part of an environmental separator, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of:

- concentrations of stress in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, and

- inadequate load distribution among the wythes of multiple-wythe masonry walls.

This is to limit the probability of cracking or buckling.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- concentrations of stress in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, and
- inadequate load distribution among the wythes of multiple-wythe masonry walls.

This is to limit the probability of cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of:

- concentrations of stress in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, and
- inadequate load distribution among the wythes of multiple-wythe masonry walls.

This is to limit the probability of cracking or buckling.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

- excessive flexibility in the connection between masonry veneer and backup framing, or
- an inability to resist lateral loads.

This is to limit the probability of the excessive flexing of masonry veneer, which could lead to cracking or buckling.

Where masonry units support or are part of an environmental separator, this is to limit the probability of excessive moisture transfer through mortar joints or cracked masonry.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F80-OS1.2] Applies to assemblies required to provide fire resistance.

---

## **Intent Statements: NBC 2010**

### **Intent(s)**

*Intent 1.* To limit the probability of:

- excessive flexibility in the connection between masonry veneer and backup framing, or
- an inability to resist lateral loads.

This is to limit the probability of the excessive flexing of masonry veneer, which could lead to cracking or buckling.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Provision: 9.20.9.5.(3)**

### **Intent(s)**

*Intent 1.* To expand the application of Subsection 4.3.2. to include masonry veneer that is individually supported by masonry or wood-frame backup on Part 9 buildings and to limit the application of Section 9.20.

---

### **Provision: 9.20.9.6.(1)**

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to lateral loads or gravity loads imposed by the glass block's own weight, which could lead to cracking at vertically aligned mortar joints.

Where glass block is part of an environmental separator, this is to limit the probability of excessive air and moisture transfer through masonry units.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to lateral loads or gravity loads imposed by the glass block's own weight, which could lead to cracking at vertically aligned mortar joints.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F20-OP2.3] Applies to elements that are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate resistance to lateral loads or gravity loads imposed by the glass block's own weight, which could lead to cracking at vertically aligned mortar joints.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Attributions**

[F20-OP2.1]

[F20, F22-OP2.4, OP2.5]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OS1

**Attributions**

[F20, F22-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads.

This is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

---

### **Objective**

OH1

### **Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or corrosion resistance of anchors, which could lead to inadequate anchorage of floor or roof assemblies to masonry walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

Where masonry units support or are part of an environmental separator, this is to limit the probability of deformation or cracking, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F20, F80-OS2.1]

[F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or corrosion resistance of anchors, which could lead to inadequate anchorage of floor or roof assemblies to masonry walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F80-OP2.1, OP2.4]

[F20, F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or corrosion resistance of anchors, which could lead to inadequate anchorage of floor or roof assemblies to masonry walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or

---

## **Intent Statements: NBC 2010**

- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F20, F80-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or corrosion resistance of anchors, which could lead to inadequate anchorage of floor or roof assemblies to masonry walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or corrosion resistance of anchors, which could lead to inadequate anchorage of floor or roof assemblies to masonry walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction, or
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F80-OS3.1] Applies to floors and elements that support floors.

[F20, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate strength or corrosion resistance of anchors, which could lead to inadequate anchorage of floor or roof assemblies to masonry walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:

- o the excessive movement or deformation of walls, or
- o the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, or
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.20.11.1.(3)**

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability that anchors will be unable to transfer lateral loads from masonry walls to floor or roof assemblies, which could lead to inadequate lateral stiffness of masonry walls, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

Where masonry units support or are part of an environmental separator, this is to limit the probability of deformation or cracking, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- inadequate lateral load distribution, which could lead to failure of the connection between intersecting walls, or
- inadequate bonding to mortar under lateral loads.

This is to limit the probability of an inability to transfer lateral loads from masonry walls to intersecting walls intended to provide lateral support, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

---

## **Intent Statements: NBC 2010**

- failure of the ties,
- inadequate lateral load distribution, which could lead to failure of the connection between intersecting walls, or
- inadequate bonding to mortar under lateral loads.

This is to limit the probability of an inability to transfer lateral loads from masonry walls to intersecting walls intended to provide lateral support, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

Where transverse masonry walls support an environmental separator, this is to limit the probability of deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of:

- failure of the ties,
- inadequate lateral load distribution, which could lead to failure of the connection between intersecting walls, or
- inadequate bonding to mortar under lateral loads.

This is to limit the probability of an inability to transfer lateral loads from masonry walls to intersecting walls intended to provide lateral support, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F80-OS3.1] Applies to floors and elements that support floors.

[F20, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of:

- failure of the ties,
- inadequate lateral load distribution, which could lead to failure of the connection between intersecting walls, or
- inadequate bonding to mortar under lateral loads.

This is to limit the probability of an inability to transfer lateral loads from masonry walls to intersecting walls intended to provide lateral support, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, or
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.20.11.3.(1)**

---

**Objective**

OH1

**Attributions**

[F20, F22, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of:

- failure of steel-rod ties, or

---

## **Intent Statements: NBC 2010**

- inadequate lateral load distribution, which could lead to failure of the connection between intersecting walls.

This is to limit the probability of an inability to transfer lateral loads from framed walls to intersecting walls, which could lead to inadequate lateral stiffness, which could lead to an inability to resist lateral loads or inadequate distribution of gravity loads, which could lead to cracking or buckling.

Where transverse wood-frame walls support an environmental separator, this is to limit the probability of deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

OP2

**Attributions**

[F20-OP2.1]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or shear strength of corbeling, which could lead to an inability to resist eccentric loading, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or

---

## **Intent Statements: NBC 2010**

- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or shear strength of corbeling, which could lead to an inability to resist eccentric loading, which could lead to cracking.

Where exterior masonry walls support an environmental separator or act as one, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or shear strength of corbeling, which could lead to an inability to resist eccentric loading, which could lead to cracking.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or shear strength of corbeling, which could lead to an inability to resist eccentric loading, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction, or
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate compressive or shear strength of corbeling, which could lead to an inability to resist eccentric loading, which could lead to cracking.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

**Provision: 9.20.12.1.(2)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1]

[F20-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads, which could lead to foundation walls being unable to resist gravity loads or earth pressure from the exterior, which could lead to cracking of foundation walls and supported walls or floors.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction, or

---

## **Intent Statements: NBC 2010**

- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F20-OP2.1, OP2.4]

[F20-OP2.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads, which could lead to foundation walls being unable to resist gravity loads or earth pressure from the exterior, which could lead to cracking of foundation walls and supported walls or floors.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to“
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads, which could lead to foundation walls being unable to resist gravity loads or earth pressure from the exterior, which could lead to cracking of foundation walls and supported walls or floors.

Where exterior masonry walls support an environmental separator or act as one, this is to limit the probability of deformation or cracking, which could lead to the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads, which could lead to foundation walls being unable to resist gravity loads or earth pressure from the exterior, which could lead to cracking of foundation walls and supported walls or floors.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Objective**

OH4

**Attributions**

[F20-OH4] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads, which could lead to foundation walls being unable to resist gravity loads or earth pressure from the exterior, which could lead to cracking of foundation walls and supported walls or floors.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20-OS3.1] Applies to floors and elements that support floors.

**Intent(s)**

*Intent 1.* To limit the probability of excessive eccentricity of loads, which could lead to foundation walls being unable to resist gravity loads or earth pressure from the exterior, which could lead to cracking of foundation walls and supported walls or floors.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- an inability to resist expected loads, which could lead to excessive deflection or vibration of floors.

For floors and elements supporting floors, this is to limit the probability of persons losing their balance, tripping or falling, which could lead to harm to persons.

---

### **Provision: 9.20.12.2.(1)**

#### **Objective**

OH1

#### **Attributions**

[F20-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate vertical support, which could lead to cracking of cavity walls.

Where exterior masonry walls support an environmental separator or act as one, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or

---

### **Objective**

OS2

### **Attributions**

[F61-OS2.1, OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F61-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OH1

**Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F61-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to resist heat transfer.

Where masonry construction is required to provide fire resistance, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Provision: 9.20.13.5.(1)**

#### **Objective**

OH1

#### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

This is to limit the probability of compromised thermal performance of components intended to resist heat transfer, which could lead to:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F61, F62-OS2.1, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F61, F62-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OS1

**Attributions**

[F61, F62-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.20.13.6.(1)**

**Intent(s)**

*Intent 1.* To expand the application of Article 9.20.13.5. to include flashing beneath weep holes in masonry veneer over masonry backing walls.

---

**Provision: 9.20.13.6.(2)**

**Objective**

OS2

**Attributions**

[F61, F62-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate drip edge or return up walls, which could lead to precipitation or meltwater ingress.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F61, F62-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of an inadequate drip edge or return up walls, which could lead to precipitation or meltwater ingress.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate drip edge or return up walls, which could lead to precipitation or meltwater ingress.

This is to limit the probability of compromised thermal performance of components intended to resist heat transfer, which could lead to:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F61, F62-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of an inadequate drip edge or return up walls, which could lead to precipitation or meltwater ingress.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Provision: 9.20.13.6.(3)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of water running down the face of the sheathing membrane or insulating sheathing, which could lead to water entering the backing assembly.

This is to limit the probability of compromised thermal performance of components intended to resist heat transfer, which could lead to:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of water running down the face of the sheathing membrane or insulating sheathing, which could lead to water entering the backing assembly.

This is to limit the probability of the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F61-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of water running down the face of the sheathing membrane or insulating sheathing, which could lead to water entering the backing assembly.

This is to limit the probability of the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to damage to the building.

---

**Objective**

OS1

**Attributions**

[F61-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of water running down the face of the sheathing membrane or insulating sheathing, which could lead to water entering the backing assembly.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.20.13.6.(4)**

---

#### **Intent(s)**

*Intent 1.* To clarify that flashing beneath weep holes in masonry veneer over wood-frame walls is deemed to be protected from sunlight and thus may be considered concealed for the purposes of choosing materials and thickness.

### **Provision: 9.20.13.7.(1)**

---

#### **Objective**

OH1

#### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

#### **Objective**

OS2

#### **Attributions**

[F61, F62-OS2.1, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F61, F62-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OS1

**Attributions**

[F61, F62-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of precipitation or meltwater ingress, or compromised thermal performance of components intended to resist heat transfer.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

**Provision: 9.20.13.8.(1)**

---

**Objective**

OS2

**Attributions**

[F62-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drainage, which could lead to water pooling in cavities or air spaces for extended periods.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F62-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drainage, which could lead to water pooling in cavities or air spaces for extended periods.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F62-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drainage, which could lead to water pooling in cavities or air spaces for extended periods.

This is to limit the probability of:

- water accumulation, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F62-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate provision for drainage, which could lead to water pooling in cavities or air spaces for extended periods.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Provision: 9.20.13.8.(2)**

---

### **Intent(s)**

*Intent 1.* To clarify the locations that require weep holes as stated in Sentence 9.20.13.8.(1).

---

### **Provision: 9.20.13.9.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture protection of interior finishes, which could lead to rainwater penetrating the interior surface of solid masonry walls and contacting vulnerable interior finishes.

This is to limit the probability of:

- water ingress and accumulation, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces or relative humidity,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture protection of interior finishes, which could lead to rainwater penetrating the interior surface of solid masonry walls and contacting vulnerable interior finishes.

This is to limit the probability of the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F61-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate moisture protection of interior finishes, which could lead to rainwater penetrating the interior surface of solid masonry walls and contacting vulnerable interior finishes.

This is to limit the probability of the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse, which could lead to damage to the building.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.20.13.9.(2)**

---

#### **Objective**

OS2

#### **Attributions**

[F61, F62-OS2.1, OS2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage, which could lead to water penetrating the interior surface of solid masonry walls, flowing along the interface of the sheathing membrane material and the interior surface of the masonry, and collecting in the wall.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F61, F62-OP2.1, OP2.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage, which could lead to water penetrating the interior surface of solid masonry walls, flowing along the interface of the sheathing membrane material and the interior surface of the masonry, and collecting in the wall.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of damage to the building.

---

#### **Objective**

OH1

#### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate drainage, which could lead to water penetrating the interior surface of solid masonry walls, flowing along the interface of the sheathing membrane material and the interior surface of the masonry, and collecting in the wall.

This is to limit the probability of:

- precipitation or meltwater ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,

- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Provision: 9.20.13.9.(3)**

**Intent(s)**

*Intent 1.* To exempt from the sheathing requirements stated in Sentence 9.20.13.9.(1) masonry construction in which the moisture protection of the interior finish is provided by means of waterproof insulation applied with waterproof adhesives.

---

**Provision: 9.20.13.10.(1)**

**Objective**

OH1

**Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of water ingress and accumulation.

This is to limit the probability of compromised thermal performance of components intended to resist heat transfer, which could lead to:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61, F62-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of water ingress and accumulation.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or

---

## **Intent Statements: NBC 2010**

- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F61, F62-OP2.1, OP2.3]

### **Intent(s)**

*Intent 1.* To limit the probability of water ingress and accumulation.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F61, F62-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of water ingress and accumulation.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Provision: 9.20.13.11.(1)**

---

### **Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.27.4., which contains requirements for caulking.

---

## **Provision: 9.20.13.12.(1)**

---

### **Objective**

OH1

### **Attributions**

[F61, F62-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of water running back under window sills or down the face of masonry, which could lead to water ingress.

This is to limit the probability of compromised thermal performance of components intended to resist heat transfer, which could lead to:

- an inadequate control of temperatures in interior spaces, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or

- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS2

**Attributions**

[F61, F62-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of water running back under window sills or down the face of masonry, which could lead to water ingress.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, which could lead to masonry falling, or
- the deterioration of elements inboard of the masonry, which could lead to compromised structural integrity, which could lead to structural collapse.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F61, F62-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of water running back under window sills or down the face of masonry, which could lead to water ingress.

This is to limit the probability of:

- the deterioration of masonry due to freeze-thaw stresses, or
- the deterioration of masonry elements, which could lead to compromised structural integrity.

This is to limit the probability of damage to the building.

---

**Objective**

OS1

**Attributions**

[F61, F62-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of water running back under window sills or down the face of masonry, which could lead to water ingress.

Where masonry veneer is installed to provide the required noncombustible cladding, this is to limit the probability of deterioration, which could lead to compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

### **Provision: 9.20.14.1.(1)**

---

#### **Objective**

OS2

#### **Attributions**

[F20, F80-OS2.1]

[F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

#### **Objective**

OP2

#### **Attributions**

[F20, F80-OP2.1, OP2.4]

[F20, F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

#### **Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

Where exterior masonry walls support an environmental separator or act as one, this is to limit the probability of:

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

**Objective**

OS1

**Attributions**

[F20, F80-OS1.2] Applies to assemblies required to provide fire resistance.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH4

### **Attributions**

[F20, F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F80-OS3.1] Applies to floors and elements that support floors.

[F20, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, or
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

## **Provision: 9.20.14.1.(2)**

---

### **Objective**

OS2

### **Attributions**

[F20, F80-OS2.1]

[F20, F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or
- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

**Objective**

OP2

**Attributions**

[F20, F80-OP2.1, OP2.4]

[F20, F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F80-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

Where exterior masonry walls support an environmental separator or act as one, this is to limit the probability of:

---

## **Intent Statements: NBC 2010**

- excessive moisture transfer through masonry units, or
- deformation or cracking, which could lead to the displacement or failure of required environmental separation elements.

This is to limit the probability of:

- condensation,
- precipitation ingress,
- moisture ingress,
- excessive heat transfer,
- pollutant ingress, or
- compromised thermal performance of components intended to resist heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures in interior spaces, drafts, relative humidity or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F80-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F80-OS3.1] Applies to floors and elements that support floors.

[F20, F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of inadequate curing conditions, which could lead to a weak mortar-to-masonry bond or an inadequate resistance to freeze-thaw stresses.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, or
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

---

**Provision: 9.20.14.2.(1)**

---

**Objective**

OS2

**Attributions**

[F80-OS2.1, OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate weather protection during construction, which could lead to the erosion of uncured mortar in joints between masonry units in the top courses, which could lead to structural failure of masonry, which could lead to harm to persons.

---

**Objective**

OP2

**Attributions**

[F80-OP2.1, OP2.3]

**Intent(s)**

*Intent 1.* To limit the probability of inadequate weather protection during construction, which could lead to the erosion of uncured mortar in joints between masonry units in the top courses, which could lead to structural failure of masonry, which could lead to damage to the building.

---

OS2

**Attributions**

[F80-OS2.1]

[F80-OS2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

**Intent(s)**

*Intent 1.* To limit the probability of the failure of connectors, which could lead to inadequate flexural strength of masonry.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure of masonry construction,
- where masonry construction is part of an environmental separator, the excessive deformation, displacement or failure of required environmental separation elements, which could lead to deterioration, which could lead to further compromised structural integrity, or

---

## **Intent Statements: NBC 2010**

- in assemblies exposed to moisture or the exterior, damage and deterioration, which could lead to further compromised structural integrity.

This is to limit the probability of harm to persons.

---

### **Objective**

OP2

### **Attributions**

[F80-OP2.1, OP2.4]

[F80-OP2.3] Applies to elements that support or are part of an environmental separator or are exposed to moisture.

### **Intent(s)**

*Intent 1.* To limit the probability of the failure of connectors, which could lead to inadequate flexural strength of masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use,
- compromised operation of windows or doors, or
- damage to the building.

---

### **Objective**

OS1

### **Attributions**

[F80-OS1.2] Applies to assemblies required to provide fire resistance.

### **Intent(s)**

*Intent 1.* To limit the probability of the failure of connectors, which could lead to inadequate flexural strength of masonry.

Where masonry construction is required to provide fire resistance, this is to limit the probability of compromised fire resistance of the assembly, which could lead to harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F80-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of the failure of connectors, which could lead to inadequate flexural strength of masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,

- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration, or
- in assemblies exposed to moisture or the exterior, damage and deterioration.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F80-OS3.1] Applies to floors and elements that support floors.

[F80-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of the failure of connectors, which could lead to inadequate flexural strength of masonry.

This is to limit the probability of:

- compromised structural integrity of masonry construction,
- where masonry construction is part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to deterioration,
- in assemblies exposed to moisture or the exterior, damage and deterioration, or
- an inability to resist expected loads, which could lead to:
  - the excessive movement or deformation of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- compromised operation of doors or windows required for egress in an emergency, or
- persons losing their balance, tripping or falling.

This is to limit the probability of harm to persons.

**Provision: 9.20.17.1.(1)**

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability that the interrupted vertical reinforcement will not be replaced, or that its replacement will be excessively remote from the wall opening, which could lead to an inadequate resistance to expected loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

[F20, F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

### **Intent(s)**

*Intent 1.* To limit the probability that the interrupted vertical reinforcement will not be replaced, or that its replacement will be excessively remote from the wall opening, which could lead to an inadequate resistance to expected loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of:

- compromised structural integrity, or

- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of:

- for floors and elements supporting floors, persons losing their balance, tripping or falling, or
- the compromised operation of doors or windows required for egress in an emergency.

This is to limit the probability of harm to persons.

---

**Provision: 9.20.17.3.(1)**

---

**Objective**

OS2

**Attributions**

[F20-OS2.1, OS2.3] [F22-OS2.3, OS2.4]

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3]

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- condensation,
- rainwater ingress,
- the ingress of moisture, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

[F20, F22-OS2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

**Objective**

OP2

**Attributions**

[F20-OP2.1]

[F22-OP2.4]

[F20, F22-OP2.3] Applies to elements that support or are part of an environmental separator.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of compromised structural integrity, which could lead to:

- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to:
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, and
- damage to the building.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OH1

### **Attributions**

[F20, F22-OH1.1, OH1.2, OH1.3] Applies to elements that support or are part of an environmental separator.

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

Where elements support or are part of an environmental separator, this is to limit the probability of:

- condensation,
- rainwater ingress,
- the ingress of moisture, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

---

### **Objective**

OH4

### **Attributions**

[F20, F22-OH4] Applies to floors and elements that support floors.

### **Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

For floors and elements supporting floors, this is to limit the probability of excessive movement, deflection or vibration, which could lead to negative effects on the psychological well-being of persons.

---

**Objective**

OS3

**Attributions**

[F20, F22-OS3.1] Applies to floors and elements that support floors.

[F20, F22-OS3.7] Applies to walls, and elements that support walls, that contain doors or windows required for emergency egress.

**Intent(s)**

*Intent 1.* To limit the probability of an insufficient area of wall between openings and corners, which could lead to an inadequate distribution of stress concentration in areas that typically experience higher levels of lateral stress (e.g. around openings), which could lead to an inability to resist transverse or vertical loads, which could lead to concrete cracking or the displacement of walls.

This is to limit the probability of:

- compromised structural integrity, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of:

- for floors and elements supporting floors, persons losing their balance, tripping or falling, or
- the compromised operation of doors or windows required for egress in an emergency, which could lead to delays in the evacuation or movement of persons to a safe place.

This is to limit the probability of harm to persons.

[F20-OS2.1, OS2.3] [F22-OS2.3, OS2.4]

#### **Intent(s)**

*Intent 1.* To limit the probability of the improper placement or insufficient embedment of anchor bolts, which could lead to anchor bolts pulling out, which could lead to the roof framing becoming detached from the insulating concrete form walls, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- elements falling from the building,
- structural failure, or
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements.

This is to limit the probability of harm to persons.

---

#### **Objective**

#### **Intent(s)**

*Intent 1.* To limit the probability of the improper placement or insufficient embedment of anchor bolts, which could lead to anchor bolts pulling out, which could lead to the roof framing becoming detached from the insulating concrete form walls, which could lead to an inability to resist expected gravity and lateral loads.

This is to limit the probability of compromised structural integrity, which could lead to:

- elements falling from the building,
- structural failure,
- where elements support or are part of an environmental separator, the displacement or failure of required environmental separation elements, which could lead to the deterioration of building elements, or
- an inability to resist expected loads, which could lead to:
  - the excessive deformation or deflection of walls, or
  - the excessive deflection or vibration of floors.

This is to limit the probability of:

- the space being unsuitable for its intended use, or
- damage to the building.

---

**Objective**

OH1

**Attributions**

[F20-OH1.1, OH1.2, OH1.3]

**Intent(s)**

*Intent 1.* To limit the probability of the improper placement or insufficient embedment of anchor bolts, which could lead to anchor bolts pulling out, which could lead to the roof framing becoming detached from the insulating concrete form walls, which could lead to an inability to resist expected gravity and lateral loads.

Where elements support or are part of an environmental separator, this is to limit the probability of the excessive deformation, displacement or failure of required environmental separation elements, which could lead to:

- condensation,
- rainwater ingress,
- the ingress of moisture, or
- compromised thermal performance of components intended to provide resistance to heat transfer.

This is to limit the probability of:

- an inadequate control of temperatures of interior spaces, relative humidity, or water accumulation,
- the generation of pollutants from biological growth or from materials that become unstable on wetting, or
- deterioration, which could lead to further compromised integrity of environmental separators.

This is to limit the probability of:

- negative effects on the air quality of indoor spaces,
- the inadequate thermal comfort of persons, and
- contact with moisture.

This is to limit the probability of harm to persons.

**Provision: 9.20.17.6.(3)**

---

**Intent(s)**

---

## **Intent Statements: NBC 2010**

*Intent 1.* To expand the application of Article 9.23.3.4. to the nailing of roof framing to wood top plates in above-ground flat insulating concrete form walls.

**Provision: 9.20.17.7.(1)**

---

**Intent(s)**

*Intent 1.* To expand the application of Section 9.27. to include cladding for above-ground flat insulating concrete form walls.

**Provision: 9.21.1.1.(1)**

---

**Intent(s)**

*Intent 1.* To state the application of Section 9.21.

**Provision: 9.21.1.1.(2)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Subsection 9.33.10., which contains requirements regarding certain chimneys and flue pipes that are beyond the application of this Section.

**Provision: 9.21.1.1.(3)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Section 6.3., which contains requirements regarding chimneys and flue pipes that are beyond the application of this Section and Section 9.33.

**Provision: 9.21.1.2.(1)**

---

**Objective**

OS1

**Attributions**

[F01-OS1.1] Applies to the walls of any *chimney* or *flue pipe*, which are required to be constructed to be flame-tight.

**Intent(s)**

*Intent 1.* To limit the probability that gaps or anomalies in chimneys or flue pipes will lead to the escape of flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Objective**

OH1

**Attributions**

[F44-OH1.1] Applies to the walls of any *chimney* or *flue pipe*, which are required to be constructed to be smoke-tight.

**Intent(s)**

---

## Intent Statements: NBC 2010

*Intent 1.* To limit the probability that combustion gases will escape from joints or anomalies in chimneys or flue pipes into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### Objective

OP1

### Attributions

[F01-OP1.1] Applies to the walls of any *chimney* or *flue pipe*, which are required to be constructed to be flame-tight.

### Intent(s)

*Intent 1.* To limit the probability that gaps or anomalies in chimneys or flue pipes will lead to the escape of flames, which could lead to the ignition of combustible building components, which could lead to damage to the building.

**Intent Statements: NBC 2010**

*Intent 1.* To limit the probability that the ignition of an oil- or gas-burning appliance will lead to a relatively sudden increase in flue pressure, which could lead to the spillage of combustion products from a solid-fuel-burning appliance, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

*Intent 2.* To limit the probability that blockage of the flue by creosote from a solid-fuel-burning appliance located at a higher level will lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.2.2.(4)**

---

**Objective**

OH1

**Attributions**

[F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that the ignition of a liquid-fuel-burning appliance will lead to a relatively sudden increase in flue pressure, which could lead to the spillage of combustion products from natural-gas- or propane-burning appliances into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Objective**

OS3

**Attributions**

[F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that the ignition of a liquid-fuel-burning appliance will lead to a relatively sudden increase in flue pressure, which could lead to the spillage of combustion products from natural-gas- or propane-burning appliances, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.2.3.(1)**

---

**Objective**

OH1

**Attributions**

[F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that an excessively long, non-vertical run in the length of a flue will contribute to the cooling of flue gases, which could lead to an inadequate draft, which could lead to the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Objective**

OS3

**Attributions**

[F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that an excessively long, non-vertical run in the length of a flue will contribute to the cooling of flue gases, which could lead to an inadequate draft, which could lead to the spillage of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.2.4.(1)**

---

**Intent(s)**

*Intent 1.* To direct Code users to Sentences 9.33.5.2.(1) and 9.33.5.3.(1), which list installation standards containing sizing requirements for chimneys.

**Provision: 9.21.2.4.(2)**

---

**Objective**

OH1

**Attributions**

[F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that back pressure, created when gases flowing through a flue pipe encounter a chimney of lesser capacity, will lead to the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

**Objective**

OS3

**Attributions**

[F44-OS3.4]

**Intent(s)**

*Intent 1.* To limit the probability that back pressure, created when gases flowing through a flue pipe encounter a chimney of lesser capacity, will lead to the spillage of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.2.5.(1)**

---

**Objective**

OH1

**Attributions**

[F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that an inadequately sized chimney flue will be unable to vent all the combustion products from a fireplace, which could lead to the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OS3

### **Attributions**

[F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that an inadequately sized chimney flue will be unable to vent all the combustion products from a fireplace, which could lead to the spillage of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

**Provision: 9.21.3.9.(1)**

---

**Objective**

OS2

**Attributions**

9.21.3.9.(1)(b) [F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry, which could lead to the structural failure of the chimney, which could lead to harm to persons.

---

## **Intent Statements: NBC 2010**

---

### **Objective**

OP1

### **Attributions**

9.21.3.9.(1)(a), 9.21.3.9.(1)(b) [F01, F20-OP1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the effects of flue gases (such as shrinkage, softening, or glazing of mortar under in-service temperatures) will lead to corrosion damage to the mortar, which could lead to thermal shock, which could lead to failure, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

### **Objective**

OH1

### **Attributions**

[F20, F44-OH1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that:

- the effects of flue gases (such as shrinkage, softening, or glazing of mortar under in-service temperatures) will lead to corrosion damage to the mortar, which could lead to thermal shock, which could lead to failure, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of the spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F20, F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that:

- the effects of flue gases (such as shrinkage, softening, or glazing of mortar under in-service temperatures) will lead to corrosion damage to the mortar, which could lead to thermal shock, which could lead to failure, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of the spillage of combustion products, which could lead to the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OS1

### **Attributions**

9.21.3.9.(1)(a), 9.21.3.9.(1)(b) [F01, F20-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that the effects of flue gases (such as shrinkage, softening, or glazing of mortar under in-service temperatures) will lead to corrosion damage to the mortar, which could lead to thermal shock, which could lead to failure, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

**Provision: 9.21.3.9.(2)**

---

**Objective**

OP1

**Attributions**

[F20, F01-OP1.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- contact with flue gases will lead to corrosive damage to mortar, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to damage to the building.

---

**Objective**

OH1

**Attributions**

[F20, F44-OH1.1]

**Intent(s)**

*Intent 1.* To limit the probability that:

- contact with flue gases will lead to corrosive damage to mortar, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of spillage of combustion products into living space, which could lead to negative effects on the air quality of indoor spaces, which could lead to harm to persons.

---

**Objective**

OS2

**Attributions**

[F20-OS2.3]

**Intent(s)**

*Intent 1.* To limit the probability that:

- contact with flue gases will lead to corrosive damage to mortar, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of:

- the structural failure of the chimney, or
- the ingress of condensed water vapour into the cavity between the chimney liner and the surrounding masonry, which could lead to freezing and induced stresses, which could lead to damage to the masonry, which could lead to the collapse of the chimney.

---

## **Intent Statements: NBC 2010**

This is to limit the probability of harm to persons.

---

### **Objective**

OS3

### **Attributions**

[F44-OS3.4]

### **Intent(s)**

*Intent 1.* To limit the probability that:

- contact with flue gases will lead to corrosive damage to mortar, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of the leakage of carbon monoxide gas into living space, which could lead to the acute poisoning or asphyxiation of persons.

---

### **Objective**

OS1

### **Attributions**

[F20, F01-OS1.1]

### **Intent(s)**

*Intent 1.* To limit the probability that:

- contact with flue gases will lead to corrosive damage to mortar, or
- flue gas condensate will leak from joints in chimney liners, which could lead to corrosion or freeze-thaw damage to surrounding masonry.

This is to limit the probability of the escape of heat or flames, which could lead to the ignition of combustible building components, which could lead to harm to persons.

---

## **Provision: 9.21.3.10.(1)**

---

### **Objective**

OS2

### **Attributions**

[F20-OS2.3]

### **Intent(s)**

*Intent 1.* To limit the probability that:

- heat from a flue pipe will be conducted into unprotected chimney masonry, which could lead to damage to the masonry in the vicinity of the flue pipe connection,
- rainwater will flow across the chimney cap and into the flue, which could lead to damage to the liner due to freeze-thaw stresses, which could lead to the ingress of condensed water vapour into the cavity between the chimney liner and the surrounding masonry, which could lead to damage to the masonry due to freeze-thaw stresses, or
